Frequency

Look at these diagrams

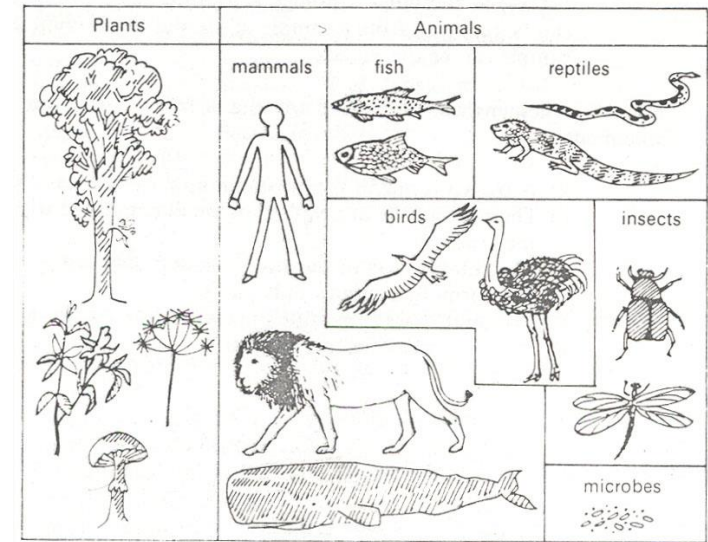

Frequency

Change the statements on the left, which you say how many members of a particular class possess a certain property, into statements of *frequency*, which say *how often* the property occurs:

Example:

All living things consist of cells.
Living things *always* consist of cells

- (a) Most plants are green.
- (b) Many birds live in trees.
- (c) Some mammals live in water.
- (d) A few plants flower at night.
- (e) Few fish leave the water.
- (f) No living things are two-dimensional.

(*always*)

(*usually*)

(*often/frequently*)

(*sometimes*)

(*occasionally*)

(*rarely*)

(*never*)

Look at this table:

occurrence	gold	tin	lead	diamond
in sedimentary rocks	•	•	•••	•
in metamorphic rocks	•••		•	
in igneous rocks	••••••••••	••••••••••	••••••••••	••••••••••
as an ore	••••••••••	••••••••••	••••••••••	
naturally occurring	•		•	••••••••••

invariably always occurs there,
therefore *certain* to be found there

usually often occurs there,
therefore *likely* to be found there
probably

sometimes occurs there,
therefore *possibly* found there

occasionally

never

Ask and answer questions from this table:

Example:

Where does tin often occur?

Tin *often* occurs in igneous rocks.

Look at this table:

occurrence	gold	tin	lead	diamond
in sedimentary rocks	•	•	•••	•
in metamorphic rocks	•••	•	•	
in igneous rocks	••••••••••	••••••••••	••••••••••	••••••••••
as an ore	••••••••••	••••••••••	••••••••••	
naturally occurring	•		•	••••••••••

Ask and answer questions from this table:

Example:

Where does tin often occur?

Tin *often* occurs in igneous rocks.

invariably always occurs there.
therefore *certain* to be found there

usually often occurs there.
therefore *likely* to be found there
probably

sometimes occurs there.
therefore *possibly* found there

occasionally

never

Gold	<i>invariably</i>	occurs
Tin	<i>always</i>	
Lead	<i>often</i>	
Diamond	<i>usually</i>	
	<i>sometimes</i>	
	<i>occasionally</i>	in sedimentary rocks.
	<i>never</i>	in metamorphic rocks.
		in igneous rocks
		as an ore.
		naturally.

Look at this table:

occurrence	gold	tin	lead	diamond
in sedimentary rocks	•	•	•••	•
in metamorphic rocks	•••	•••	•	
in igneous rocks	••••••••••	••••••••••	••••••••••	••••••••••
as an ore	••••••••••	••••••••••••••••••••	••••••••••	
naturally occurring	•		•	••••••••••••••••••••

Answer these questions orally:

- Which minerals are occasionally found in sedimentary rocks?
- Which mineral always occurs as the ore?
- Which minerals occasionally occur naturally?
- Which type of rock is most likely to yield minerals?
- Is it possible for gold to be found in sedimentary rocks?
- Is it possible for diamond to occur as an ore?
- What is the most probable type of rock in which to find lead?
- What is its more probable state when it is found?

invariably always occurs there,
therefore *certain* to be found there

usually often occurs there,
therefore *likely* to be found there
probably

sometimes occurs there,
therefore *possibly* found there

occasionally

never

Tendency

Generalizations which have exceptions express a *tendency*. These statements mean the same:

Most people live in houses.

People *generally* live in houses.

People *tend to* live in houses.

Now make statements about the Earth sciences. Add the verb *tend to* to those which express tendency. Add *always* to those which are absolutely true. Add *sometimes, rarely, never* etc. to the others.

Predicting Probability

Scale

If something occurs, then it will *certainly* occur

100%

If something *nearly always* occurs, then it will
almost certainly occur

.

usually = *will probably*

.

often = *may well*

.

sometimes = *may/will possibly*

50%

occasionally = *might*

.

rarely = *probably will not*

.

seldom = *probably will not*

0%

The statements about frequency are based on *observation*. From them we can make *predictions* about the likelihood of something happening. **Thus, we know from observation that rooms always have walls. Therefore, we can predict that the next room we see will certainly have walls.**
