

KİL MİNERALOJİSİ

1. Nedir? Tanımı

- a. $< 2 \mu\text{m}$
- b. bileşimi
 - - silikatlar
 - kaolin, smektit grubu vs. Kaolinit, montmorillonit vs
 - - oksitler
 - $\text{SiO}_2, \text{Fe}_2\text{O}_3, \text{Al}_2\text{O}_3$

1. Niçin Önemlidir?
 - a. kimyasal özellikleri
 - - birçok reaksiyon için geniş yüzey alanı
 - - elektiriksel yük
 1. positif yük (çok ayrışmış topraklarda anyon adsorbsiyonu)
 2. negatif yük (en genel olan, Ca^{2+} , Mg^{2+} , K^+ , NH_4^+ , Na^+)
 3. değişebilir yük (pH'ya bağlı)
 - b. fiziksel özellikleri
 - - suyu sıkıca tutar
 - - şişer – büzülür, porlar suyla dolunca kapanır, kök gelişimini etkiler

1. Nerden Gelirler?

a. Kalıtsal

b. Toprak içinde oluşur

- toprakta hafif değişimler, mika → vermikulite

- silikat artıklarının yeniden birleşimi

- iyonlardan oluşum

laboratuarda kaolinit, smektit

arazide yeni mineraller (ana materyalle ilişkili olmayan)

1. Sonunda Ne olur?
 - a. ayrışmaya dayanıklı olanlar toprakta kalır
 - b. diğer kil minerallerine dönüşür
 - c. erozyona uğrar, yıkanır
 - d. çözünür ayrışma ürünleri uzaklaşır
 - e. en sonunda Fe, Al oksitler şeklinde kalır
Si yıkanır

The Octahedral Sheet (trioctahedral)

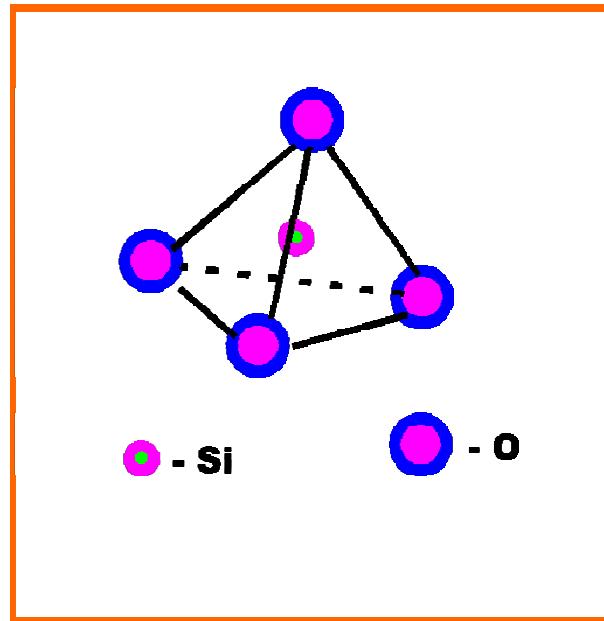

The Octahedral Sheet (dioctahedral)

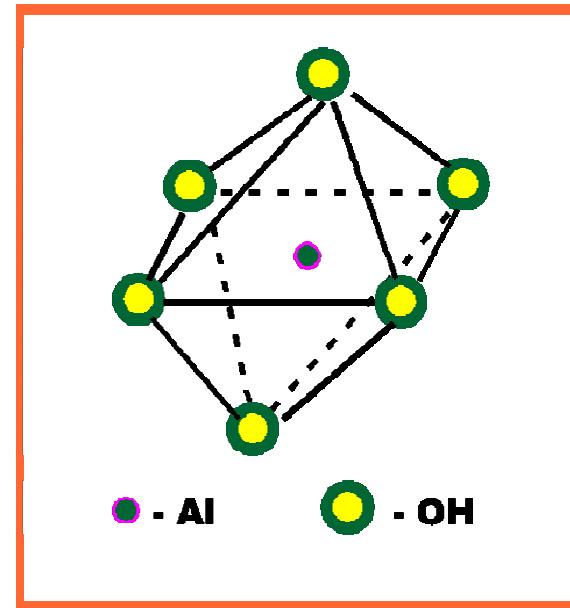

Tabakalı Silikat Killerinin Yapısı (basit yapı blokları)

1. Tetrahedron - SiO_4

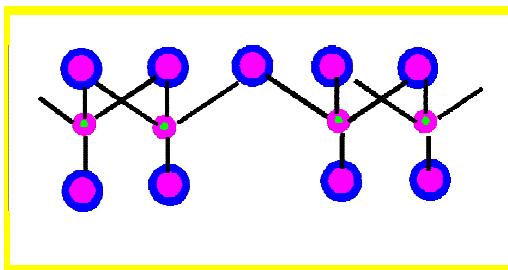

2. Octahedron - Al(OH)_6

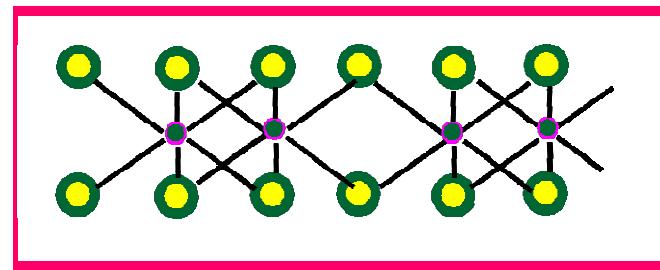

O ve OH gruplarının paylaşımı = *levhalar* ve birim tabakalar

(a) tetrahedral tabaka

(b) octahedral tabaka

Tetrahedral ve octahedral tabakalar aşağıda gösterildiği gibi çizilirler

2:1 Building block

İzomorfik yerdeğişim = kristal oluşumu sırasında atomların yerdeğişimi

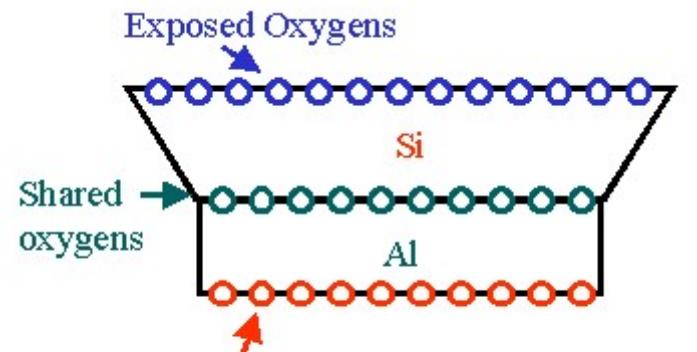

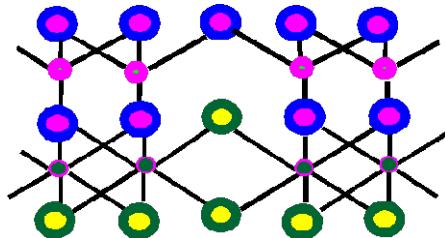

Zn^{+2} for Al^{+3}
or Al^{+3} for Si^{+4}
or Cu^{+2} for Mg^{+2}

Devamlı yük'lere (permanents charge) neden olur

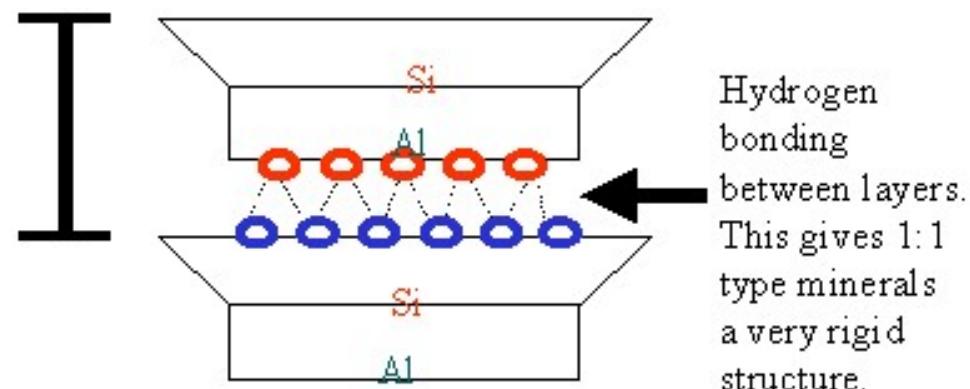

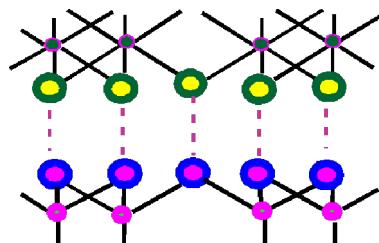

Substitution	Charge Deficit
Al^{+3} for Si^{+4}	-1
Mg^{+2} for Al^{+3}	-1

A. 1:1 Type Minerals

1. Mostly, *kaolinite*

2. Unit layers H-bonded together

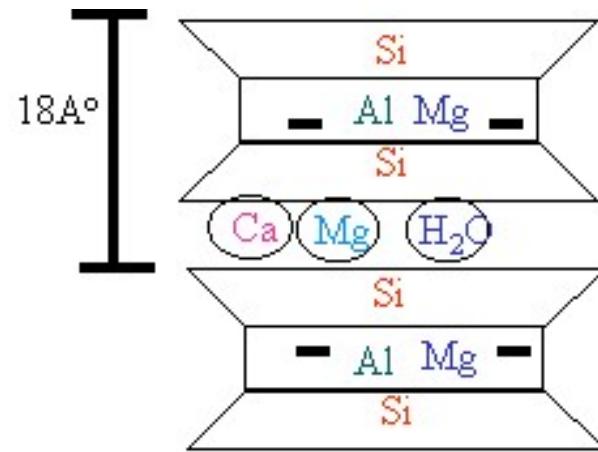

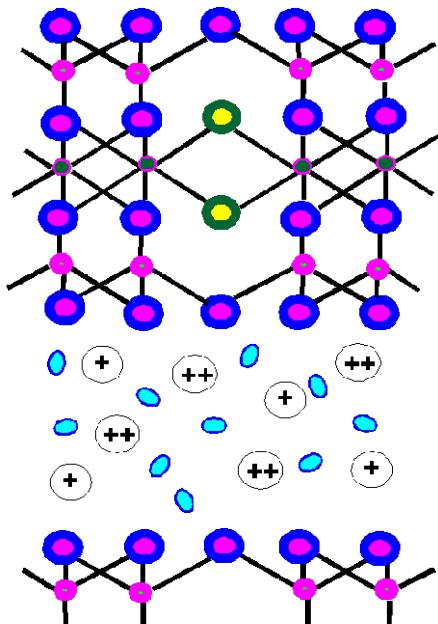

➔ genişlemeyen sabit tabaka "fixed lattice type"

- ✓ tabakalar içersinde negatif yük yok (no interlayer activity)
- ✓ Şişme – büzülme yok (no shrink-swell)
- ✓ Sadece dış yüzeylerde katyon değişimi (only external surface)
 - ✓ İyi cırtallenmiş (Well crystallized)
 - (a) Çok az izomorfik değişim (little isomorphous substitution)
 - ✓ Düşük katyon adsorsiyonu (low cation adsorption)
 - (b) Büyük tane büyüklüğü (larger particle size (0.1 - 5 μ m))
 - hexagonal şekilli (shaped)

B. 2:1 Tipi Kil Mineralleri

1. Genişleyen tabakalı

(a) Smectite grubu (genelde, *montmorillonite*)

Some substitution of Mg for Al in the octahedral layer leads to permanent negative charge. Ca or Mg can move into the interlayer spaces. Water can also move in and out

(b) Serbestçe genişleyen

- * tabakalar arasında su = yüksek şişme-büzülme
- * tabakalar arasında adsorbe katyonlar
 - iç ve dış yüzeylerde izomorfik değişim
- * geniş iç yüzey

(c) Zayıf kristallemiş

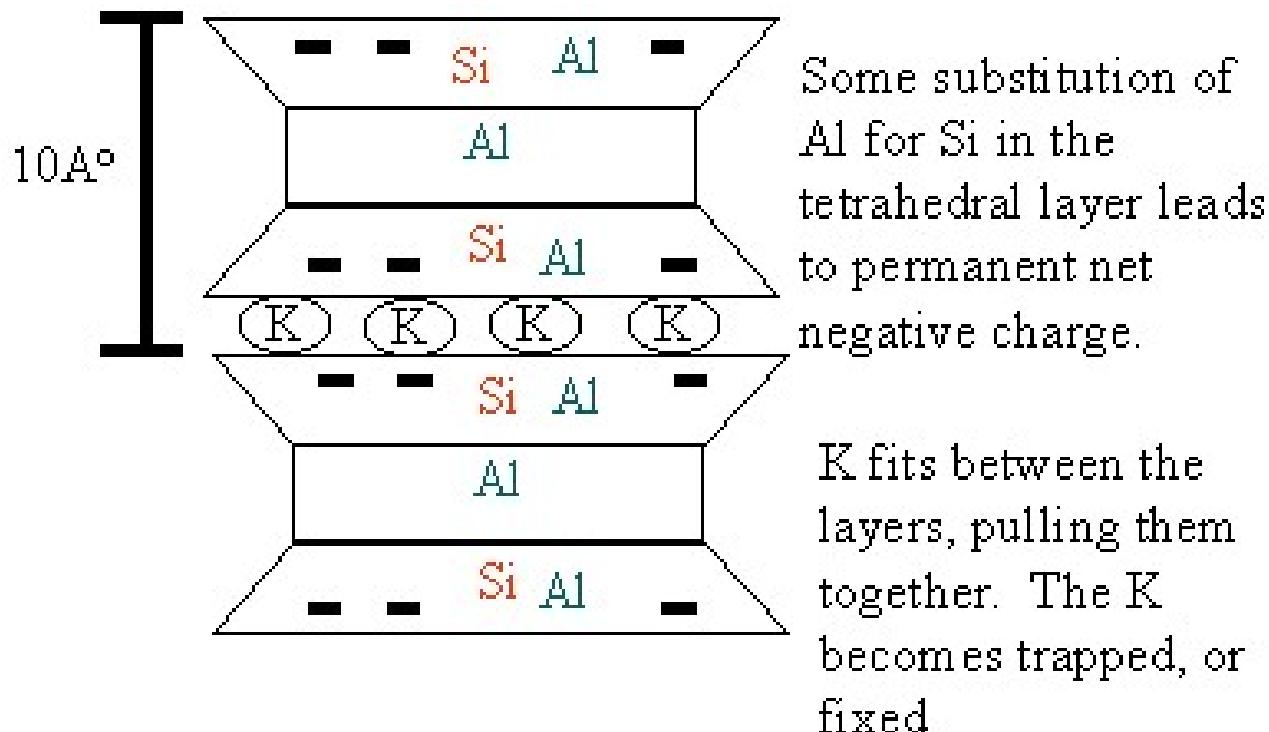

- * boyutları küçük
- * izomorfik değişim = yüksek katyon adsorbsiyonu

(d) Vermiculite

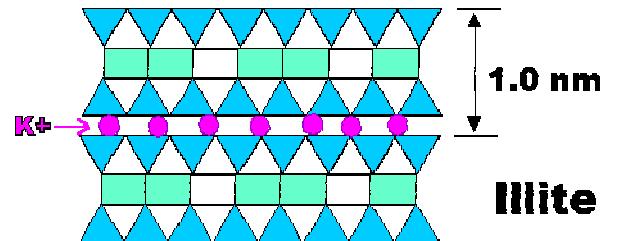

- * smectites benzer, tetrahedral tabakadaki, yerine Si^{+4} , Al^{+3} yok
- * tabakalar içi iyonlar genelde $(\text{Mg}^{+2} + \text{H}_2\text{O})$ ile yapılandırılmıştır
 - = sınırlı genişleme
- * yüksek katyon adsorbsiyonu

2. Genişlemeyen tabakalı

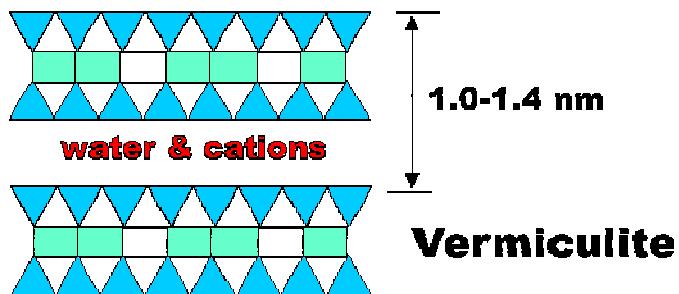

(a) İnce taneli mikalar veya illit

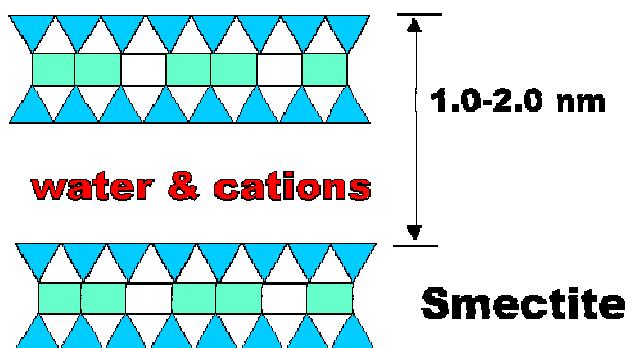

- ◆ Al^{+3} ve K^+ yerdeğişimi, Si^{+4} (tetrahedral sheet) için
- ◆ Kenarlarda ayrışma = K^+ salınımı
 - çok sınırlı genişleme
 - orta katyon adsorbsiyonu
 - sınırlı iç yüzey
 - kaolinite ve vermiculite arasındaki özellikler
- (b) Kloritler (Chlorites)
 - ◆ illite ki K^+ , gibi octahedral tabakaya Mg- yerleşir
 - ◆ illite benzer özellikler

Vermiculite

Smectite

2:1 tipi killerin kıyaslaması

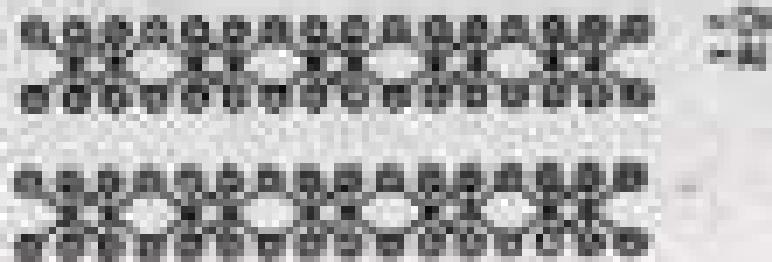

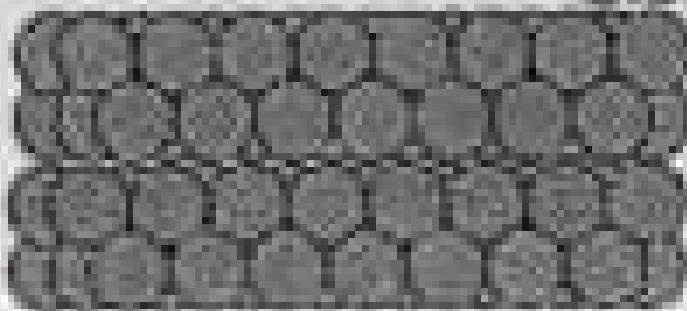

Özet

	<u>Büyülüklük (μm)</u>	<u>Yüzey alanı (m^2/g)</u>		<u>Tabakalar Arası boşluk (nm)</u>	<u>Katyon adsorbsiyon ü</u>
		dış	İç		
Kaolinite	0.1-5.0	10-50	-	0.7	5-15
Smectite	<1.0	70-150	500-700	1.0-2.0	85-110
Vermiculite	0.1- 5.0	50-100	450-600	1.0-1.4	100-120
Illite	0.1-2.0	50-100	5-100	1.0	15-40
Humus	kaplama	-	-	-	100-300

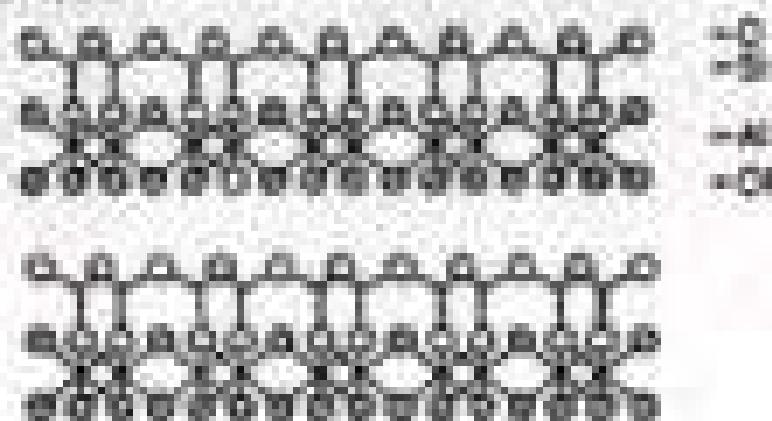

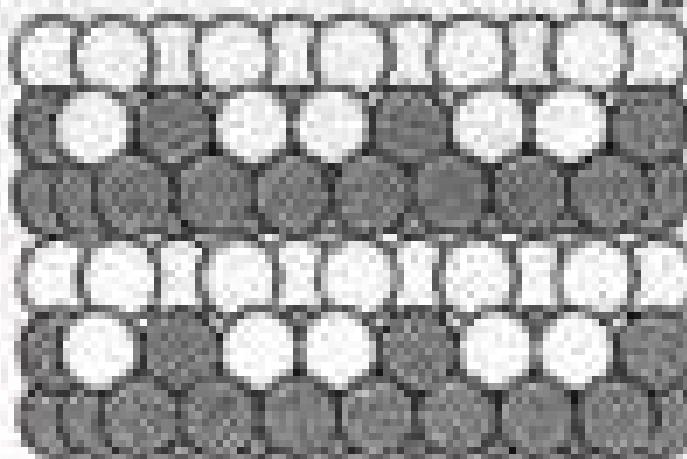

Kil minerallerinin sonu

- Bazıları çok dirençlidir toprakta kalır
- Bazıları diğer kil minerallerine dönüşür
- Erozyonla yıkanır
- ayrışır ve uzaklaşır
- sonunda
 - Fe, Al oksitler olarak kalır
 - Si yıkanır

Bu metodun en önemli sınırlaması, fazla miktarda amorf unsurlar bulunan durumlarda belli bir pik elde edilmemesidir. Şekil 3.18 de tipik bir kıl mineraline ait x-ışın difraktogramı görülmektedir.

Şekil 3.18. Bir kıl mineraline ait x- ışın difraktogramı (Munsuz, 1974).
