

CROP PRODUCTION

Crop Plant Classification and Identification

Scientific Classification

- Carl Linnaeus – A Swedish botanist developed this system
- Latin was written language of science, so it is now used to name species
- All crops are part of the plant kingdom and *Magnoliophyta* division
- The “class” divides plants into *Lilliopsida* (monocot) and *Magniopsida* (dicot)

Important Crop Families

- Bean/legume family: *Fabaceae*
—15,000 species
(alfalfa, soybeans, clover, pea, peanut)
- Grass family: *Poaceae*—8,000 species
(wheat, rice, barley, maize, sorghum)

Other Important Plant Families

- Mustard: *Brassicaceae* – cabbage, mustard, rape
- Potato: *Solanaceae* – tobacco, tomato
- Sunflower: *Asteraceae* – safflower
- Mallow: *Malvaceae* – cotton, kenaf
- Lily: *Liliaceae* – garlic, onion

Binomial Nomenclature

- Bi = two (2) -nomial = names
- First name is genus and second name is species ; such as *Triticum*
- Know binomial names for the following plants *Triticum durum*.... --- look→

Some Binomial Nomenclature

Examples :

- Barley: *Hordeum vulgare*
- Oats: *Avena sativa*
- Rye: *Secale cereale*
- Wheat: *Triticum aestivum*
- Peanut: *Arachis hypogaea*
- Potato: *Solanum tuberosum*
- Cotton: *Gossypium hirsutum*
- Alfalfa: *Medicago sativa*
- Smooth Bromegrass: *Bromus inermis*
- Maize: *Zea mays*
- Rice: *Oryza sativa*
- Sorghum: *Sorghum bicolor*
- Bean: *Phaseolus vulgaris*
- Soybean: *Glycine max*
- Sugarcane: *Saccharum officinarum*
- Tobacco: *Nicotiana tabacum*
- Red Clover: *Trifolium pratense*
- Kentucky Bluegrass: *Poa pratensis ...*

Other Categories of Life....

Five kingdoms

Plants

Fungi

Animals

Protista

eukaryotic

prokaryotic

Monera

prokaryotic

Monera

Bacteria – simple interior organization, lack compartmentalization and membrane bound organelles, and reproduce by binary fission – simple cell division

- Nutrient recycling and breakdown of residues, pesticides, and wastes
- Causative agent for diseases
- Improvement of soil structure through OM decomposition
- Nitrogen fixation
- Disease organisms of weeds and insects, acting as natural control

Protista

eukaryotic

- Algae and other organisms— unicellular and multicellular organisms; some can conduct photosynthesis (not all)
- Basis of aquatic foodchains
 - Contribute to overall health of aquatic systems

Fungi

- No photosynthesis, saprophytic or parasitic feeding, and reproduce by one of three ways (fission, budding, spores)
- Ecological recycling
- Causative agents for disease
- Improvement of soil structure through OM decomposition
- Natural control of insects and weeds
- Food utilization in positive (flavor enhancement) and negative (spoilage) ways
- Help with mineral uptake by plants (mycorrhizal association)

Viruses

Not always regarded as “living” but have importance to ag in two ways:

- Causative agents of disease
- Natural control of insects, weeds, and diseases

Place of Origin

Eight centers of origin;
know crops originating
from following places

- China: soybean
- India: rice
- Central Asia: wheat
- Middle East: alfalfa & small grains
- Mediterranean: white clover
- Ethiopia: sorghum
- Central America: maize
- South America: potato

Centers of origin of selected crops

Note: The pointer locations indicate general regions where crops are believed to have first been domesticated. In some cases, the center of origin is uncertain. Other geographic regions also harbor important genetic diversity for these crops.

Source: This map was developed by the General Accounting Office using data provided by the National Plant Germplasm System's Plant Exchange Office.

Plants are known as indigenous (being native to an area) or exotic (being introduced to an area)

Crops Native to the Western Hemisphere

- Grasses
- Maize
- Cotton
- Peanut
- Pumpkin
- Tomato
- Sunflower
- Potato
- Sweet potato
- Tobacco

Classification by Use

- **Grain**: cereal, small grains, and pulse
- **Forage**: hay, silage, and greenchop

Classification by Use (cont.)

- Specific Use:
 - **Companion**: “nurse”—help with erosion control and weed growth—seed w/other crop
 - **Cover**: protect soil and wildlife habitat
 - **Green manure**: incorporated into soil to improve fertility
 - **Seed**: produce seed for planting
 - **Trap**: attract insects/parasites
 - **Oil**: high oil content/properties
 - **Fiber**: paper/textile industries
 - **Root and tuber**: desirable food products
 - **Sugar**: juice w/high sucrose
 - **Drug/medicinal/stimulant**: extracts for purposes
 - **Biofuel**: direct combustion or converted to liquid

Classification by Use

(cont.)

- Classifications and terms used in cropping systems
 - Crop selection across years
 - Crop rotation—yearly planned succession over years
 - Fallow—uncropped, free of weeds to conserve moisture and fertility
 - Monoculture—repeat crop on the same field
 - Pertaining to arrangement
 - Single cropping—one crop per field
 - Multiple cropping—sequential and intercropping

Life Cycle

- **Annuals—**one year
 - Spring—utilize spring months for growth/maturation; harvest early summer
 - Summer—utilize summer months for growth/maturation; harvest in fall
 - Winter—utilize parts of two growing seasons; plant fall, winter vernalization, summer harvest
- **Biennials—**two growing seasons
- **Perennials—**indefinite life period

Identification

- Vegetative plant ID characteristics—
broadleaves:
 - Simple or compound leaves
 - Blade/leaflet shape
 - Blades or margins
 - Leaf attachments—sessile, petioled, amplexical (clasping), or decurrent
 - Leaf arrangements—alternate, opposite, (also whorled)

Identification (cont.)

- Vegetative plant ID characteristics—
grasses
 - Vernation—folded or rolled
 - Sheath—split, overlapping margins or closed
 - Ligule—absent, membranous, or fringed (hairs)
 - Auricles—large, small, and absent

Identification (cont.)

- Common flower types
 - Grass
 - Composite
 - Simple
 - Leguminous

Identification (cont.)

- Inflorescence types
 - Spike
 - Raceme
 - Panicle
 - Umbel
 - Head

Identification (cont.)

- Common field crops—be able to ID plants and seeds as indicated by the instructor
 - Field Crops—divide list among class and complete the table
 - Forages—divide list among class and complete the table

Identification (cont.)

- Common forage grasses—useful seed ID characteristics
 - Glumes
 - Lemma—size, shape, texture, color, number of nerves and others
 - Palea
 - Rachilla—length, shape, pubescence, and nature of abscission or fracture

Identification (cont.)

- Common forage grasses—seed ID
 - Timothy
 - Sorghum
 - Orchard grass
 - Tall fescue
 - Smooth bromegrass
 - Reed canary grass
 - Kentucky bluegrass
 - Ryegrass

Identification (cont.)

- Common forage legumes—flowering plant ID
 - Inflorescence—raceme, head, or umbel; irregular flowers and may require insect pollination
 - Standard 5 petals and 10 stamens
 - Serrated leaflet—notches or slits in the leaflet margin
 - Petiolule—attaches leaflets to petiole
 - Pubescence—hair-like projections

Identification (cont.)

- Common forage legumes—flowering plant ID
 - Glabrous—no pubescence
 - Raceme—flowers attached to a pedicel (attached to rachis)
 - Head—individual flowers fastened close together to give continuous appearance
 - Umbel—inflorescence in which pedicels arise from same level

Identification (cont.)

Common forage legumes—flowering plant ID

- Forage legumes—divide list among the class and complete the table

Identification (cont.)

- Common forage legumes—useful seed identification characteristics
 - Color
 - Size
 - Texture
 - Shape

Identification (cont.)

- Common forage legumes—seed ID
 - Alfalfa
 - Red clover
 - White (ladino) clover
 - Birdsfoot trefoil
 - Sweet clover
 - Alsike clover
 - Korean Lespedeza
