

Bioremediation

use of microbes, (bacteria and fungi), in the removal of contaminants, pollutants, and toxins from soil and water environments. Bioremediation is usually used to clean up oil spills or contaminated groundwater.

How does bioremediation work?

1

Bioaugmentation is the introduction of contaminant-specific microbes to soil to enhance the contaminant degradation

2

Biostimulation is the addition of nutritional supplements for the indigenous bacteria to promote the bacterial degradation of contaminants.
