## CYLINDER PROJECTIONS

Geographic Projection

Equiarectangular Projection

Center Cylinder Projection

Gall Projection

Lambert Cylinder Projection

Mercator Cylinder Projection

Mollweide Projection

Sinusoidal Projection

Eckert Projection

Robinson Projection

Winkel Tripel Projection

Segmented Projections

Central Meridian Change

Drawing of the graticule (grid network) of the Eckert 1 projection at a scale of 1/100,000,000 (Interval: 30 degree) and showing the location of Turkey.

0 2000 km

Pseudo

Equator

$$2\pi R = 2 * 3,14 * 6,37 = 40\text{cm}$$

Central meridian and poles

$$\pi R = 3,14 * 6,37 = 20\text{cm}$$

**Parallels**

Spaces are equal

$$\frac{20}{180} * 30 = 3,33$$

**Meridians**

$$\frac{20}{360} * 30 = 1,67$$

$$\frac{40}{360} * 30 = 3,33$$

Logic

Maintain the equator length  
Maintain the central meridian length  
Poles are equal to a meridian

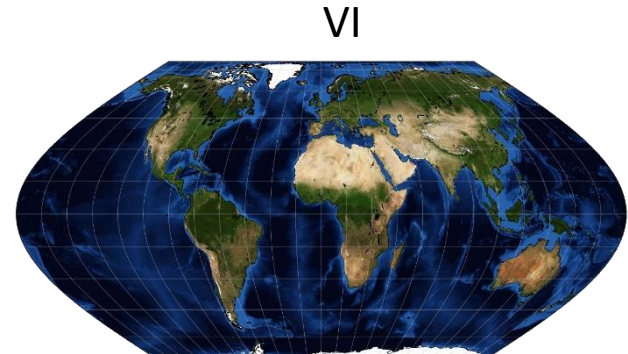

## Features of Projection

- Entire world.
- Parallels are straight lines parallel to the equator.
- Parallel spaces are equal.
- **Meridians are oblique.**
- **Meridian spaces are equal at any parallel.**
- The equator and central meridian and their immediate surroundings have low error.
- Distortion rates increase going away from the equator and central meridian.

## Eckert I, II, III, IV, V, VI

### Usage

- Atlas.
- Modis image

Drawing of the graticule (grid network) of the Sinusoidal projection at a scale of 1/100,000,000 (Interval: 30 degree) and showing the location of Turkey.

Pseudo  
Merkator-Sanson

Equator

$$2\pi R = 2 * 3,14 * 6,37 = 40\text{cm}$$

Central Meridian

$$\pi R = 3,14 * 6,37 = 20\text{cm}$$

**Parallels**

Spaces are equal

Maintain the length

$$\frac{20}{180} * 30 = 3,33$$

Logic

Maintain the equator length  
Maintain the central meridian length  
Maintain the parallels length

**Parallels Length**

$$\varphi_{30} = 2\pi \cos 30 * R = 2 * 3,14 * 0,8660 * 6,37 = 34,64$$

$$\frac{34,64}{2} = 17,32\text{cm}$$

$$\frac{17,32}{6} = 2,89$$

$$\varphi_{60} = 2\pi \cos 60 * R = 2 * 3,14 * 0,5 * 6,37 = 20$$

$$\frac{20}{2} = 10\text{cm}$$

$$\frac{10}{6} = 1,67$$

**Meridians drawings**

## Features of Projection

- Entire world.
- **Equal area**
- Parallels are straight lines parallel to the equator.
- Parallel spaces are equal.
- **Meridians are sinus arcs.**
- **Meridian spaces are equal at any parallel.**
- The equator and central meridian and their immediate surroundings have low error.
- Distortion rates increase going away from the equator and central meridian.

Sinusoidal  
Sanson-Flamsteed  
Mercator equal-area

## Usage

- Equal area maps
- Atlas.

# MOLLWEIDE PROJeksiYON

Drawing of the graticule (grid network) of the Mollweide projection at a scale of 1/100,000,000 (Interval: 30 degree) and showing the location of Turkey.

0 2000 km

Sphere Area

$$4\pi R^2$$

A Hemisphere Area

$$\frac{4\pi R^2}{2} = 2\pi R^2$$

Circle Area

$$\pi r^2$$

$$\pi r^2 = 2\pi R^2$$

$$r = 6,37 * 1,41 = 8,98$$

Logic

Equal area

$$r = R\sqrt{2}$$

$$\sqrt{2} \cong 1,41$$

Parallels

$$h_{\varphi 30} = \sin 30 * R = 0,5 * 6,37 * 1,14 = 4,49$$

$$h_{\varphi 60} = \sin 60 * R = 0,866 * 6,37 = 7,78$$

$$\sin \varphi = \frac{\text{opp}}{\text{hyp}}$$

$$\sin \varphi = \frac{h_{\varphi}}{R\sqrt{2}}$$

$$h_{\varphi} = \sin \varphi * R\sqrt{2}$$

## Features of Projection

- Entire world.
- **Equal area**
- Parallels are straight lines parallel to the equator.
- Parallel spaces are narrower away from equator.
- **Meridians are circular arcs.**
- **Meridian spaces are equal at any parallel.**
- The equator and its immediate surroundings have low error.
- Distortion rates increase going away from the equator and central meridian.

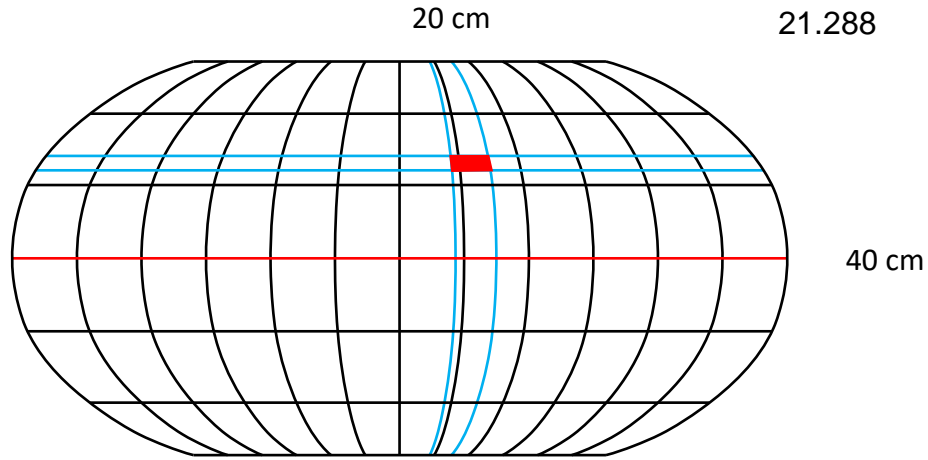

## Usage

- Distribution maps.
- Atlas.
- It is used in the making of maps that aim to maintain the area.

Drawing of the graticule (grid network) of the Robinson projection at a scale of 1/100,000,000 (Interval: 30 degree) and showing the location of Turkey.

0 2000 km

Pseudo

**Equator**

$$2\pi R = 2 * 3,14 * 6,37 = 40\text{cm}$$

**Central Meridian**

$$\pi R = 3,14 * 6,37 = 20\text{cm}$$

**Poles**

$$0.5322 * 40\text{cm} = 21.288\text{cm}$$

**Parallels**

$$\frac{20}{360} * 30 = 1,67$$

**Meridians at equator**

$$\frac{40}{360} * 30 = 3,33$$

**Meridians at the poles**

$$21.288/360 * 30 = 1.774 \text{ cm}$$

Logic

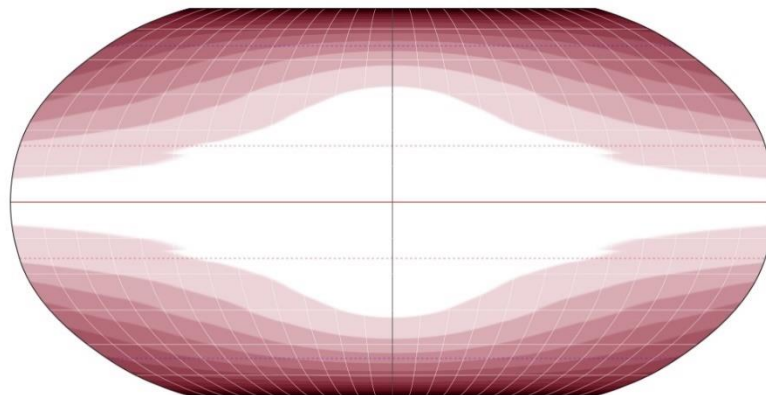

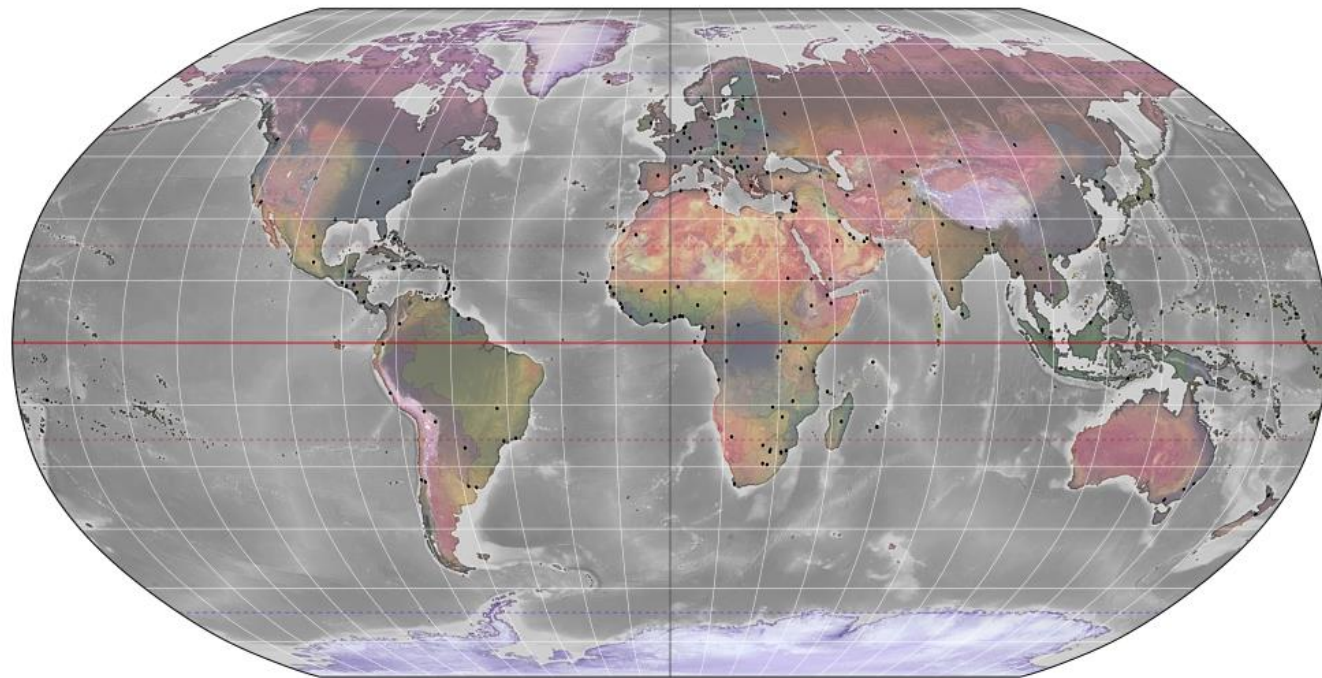

Maintain the equator length  
Maintain the central meridian length  
Poles are equal to **0.5322** times equator

lat $\phi$ , in degrees	X	Y
90	0.5322	1.0000
85	.5722	.9761
80	.6213	.9394
