# Physics 101: Mechanics Lecture 7

## Lets remember Uniform Circular Motion

Figure 6.1 Physics for Scientists and Engineers 6th Edition, Thomson Brooks/Cole © 2004; Chapter 6 Figure 6.2 Physics for Scientists and Engineers 6th Edition, Thomson Brooks/Cole © 2004; Chapter 6

Physics for Scientists and Engineers 6th Edition, Thomson Brooks/Cole © 2004; Uniform circular motion

Constant speed, or, constant magnitude of velocity

Motion along a circle: Changing direction of velocity

## **Uniform Circular Motion: Observations**

- Object moving along a curved path with constant speed
  - Magnitude of velocity: same
  - Direction of velocity: changing
  - Velocity  $\vec{v}$ : changing
  - Acceleration is NOT zero!
     Therefore Net force acting on an object is NOT zero
  - \* "Centripetal force"

 $= m\vec{a}$ F

## **Uniform Circular Motion**

#### Magnitude:

# **Uniform Circular Motion**

- Velocity:
  - Magnitude: constant v
  - The direction of the velocity is tangent to the circle
- Acceleration:
  - Magnitude:

 directed toward the center of the circle of motion

#### Period:

 time interval required for one complete revolution of the particle

V

## **Centripetal Force**

 Direction: toward the center of the circle of motion

## What provide Centripetal Force ?

- not a new kind of force
- The centripetal force represents any force that follows the object in a circular path

$$F_c = ma_c = \frac{mv^2}{r}$$

#### Centripetal force

- Gravitational force mg: downward to the ground
- Normal force N: perpendicular to the surface
- Tension force T: along the cord and away from object
- Static friction force:  $f_s^{max} = \mu_s N$

is a combination of 4 forces

## What provide Centripetal Force ?

Figure 6.2 Physics for Scientists and Engineers 6th Edition, Thomson Brooks/Cole © 2004; Chapter 6

$$F_{net} = N - mg = ma$$
$$N = mg + m\frac{v^2}{r}$$

Physics for Scientists and Engineers 6th Edition, Thomson Brooks/Cole © 2004;

$$F_{net} = T = ma$$
$$T = \frac{mv^2}{r}$$

#### The Conical Pendulum

■ A small ball of mass m is suspended from *a* string of length *L*. The ball revolves with constant speed *v* in a horizontal circle of radius *r*. Find an expression for *v* and *a* m=5 kg L=10 m r=4 m

Figure 6.4 Physics for Scientists and Engineers 6th Edition, Thomson Brooks/Cole © 2004; Chapter 6  $m = 5 \ kg \quad L = 10 \ m \quad r = 4 \ m$  $\sum F_y = T \cos \theta - mg = 0$  $T \cos \theta = mg$  $\sum F_x = T \sin \theta = ma_c = \frac{mv^2}{r}$  $\sin \theta = \frac{r}{L} = 0.4$  $\tan \theta = \frac{r}{\sqrt{L^2 - r^2}} = 0.44$ 

Physics for Scientists and Engineers 6th Edition, Thomson Brooks/Cole © 2004;

#### The Conical Pendulum

#### $\Box$ Find *v* and *a*

$$m = 5 \ kg \quad L = 10 \ m \quad r = 4 \ m$$
$$\sum F_y = T \cos \theta - mg = 0$$
$$T \cos \theta = mg$$
$$\sum F_x = T \sin \theta = \frac{mv^2}{r}$$
$$\sin \theta = \frac{r}{L} = 0.4$$
$$\tan \theta = \frac{r}{\sqrt{L^2 - r^2}} = 0.44$$

$$T \sin \theta = \frac{mv^2}{r}$$
$$T \cos \theta = mg$$
$$\tan \theta = \frac{v^2}{gr}$$
$$v = \sqrt{rg \tan \theta}$$
$$v = \sqrt{Lg \sin \theta \tan \theta} = 2.9 \text{ m/s}$$
$$a = \frac{v^2}{r} = g \tan \theta = 4.3 \text{ m/s}^2$$

# Level Curves

□ A 1500 kg car moving on a flat, horizontal road negotiates a curve as shown. If the radius of the curve is 35.0 m and the coefficient of static friction Figure 6.5 Physics for Scientists and between the tires and dry Engineers 6th Edition, Thomson Brooks/Cole © pavement is 0.523, find the 2004; Chapter6 maximum speed the car can have and still make the turn successfully.

# Level Curves

The force of static friction directed toward the center of the curve keeps the car moving in a circular path.

$$f_{s,\max} = \mu_s N = m \frac{v_{\max}^2}{r}$$

$$\sum F_y = N - mg = 0$$

$$N = mg$$

$$v_{\max} = \sqrt{\frac{\mu_s Nr}{m}} = \sqrt{\frac{\mu_s mgr}{m}} = \sqrt{\mu_s gr}$$

$$= \sqrt{(0.523)(9.8m/s^2)(35.0m)} = 13.4m/s$$

# **Banked Curves**

□ A car moving at the designated speed can negotiate the curve. Such a ramp is usually banked, which means that the roadway is tilted toward the inside of the curve. Suppose the designated speed for the ramp is to be 13.4 m/s and the radius of the curve is 35.0 m. At what angle should the curve be banked?

Figure 6.6 Physics for Scientists and Engineers 6th Edition, Thomson Brooks/Cole © 2004; Chapter 6

Physics for Scientists and Engineers 6th Edition, Thomson Brooks/Cole © 2004;

# **Banked Curves**

v = 13.4 m/s r = 35.0 m $\sum F_r = n \sin \theta = ma_c = \frac{mv^2}{r}$  $\sum F_{v} = n\cos\theta - mg = 0$  $n\cos\theta = mg$  $\tan\theta = \frac{v^2}{rg}$  $\theta = \tan^{-1}(\frac{13.4 \text{ m/s}}{(35.0 \text{ m})(9.8 \text{ m/s}^2)}) = 27.6^{\circ}$ 

#### **Motion in Accelerated Frames**

Figure 6.11 – 6.12 Physics for Scientists and Engineers 6th Edition, Thomson Brooks/Cole © 2004; Chapter 6

Physics for Scientists and Engineers 6th Edition, Thomson Brooks/Cole © 2004;

What caused him to go to the door? This is commonly referred to as "centrifugal force" but is an imaginary force due to the acceleration associated with the changing direction of the vehicle's velocity vector He slides toward the door, not because of an outward force, but it is not good enough to allow the friction force to pass through the circular path that the car tracks.
