# AQS421: Aquatic Invertebrates

## 1. Week: Introduction

Reference: Brusca, R. C., & Brusca, G. J. **Invertebrates**. 2003.  
Sunderland, MA: Sinauer Associates, 2.

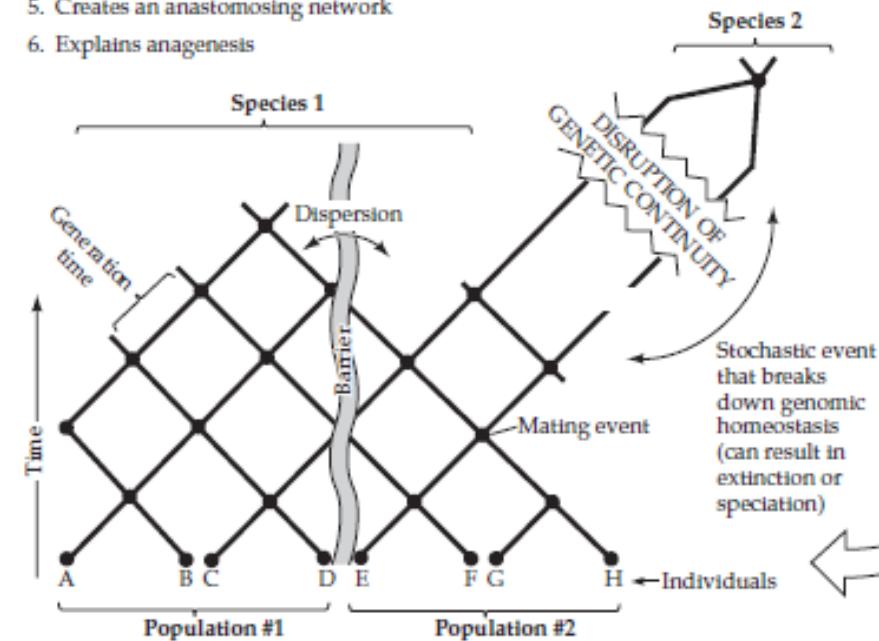

**Microevolution (Within species evolution)**

1. Individuals and populations linked by gene flow (e.g., reproductive ties, dispersion)
2. Process produces pattern of reticulation
3. Acts on individuals (e.g. natural selection)
4. Works to maintain genomic continuity (i.e. evolutionary homeostasis)
5. Creates an anastomosing network
6. Explains anagenesis

**Macroevolution (Species/clade evolution)**

1. Species linked by speciation events
2. Process produces pattern of bifurcation ("dendrogram")
3. Acts on species
4. Disrupts genomic continuity
5. Creates hierarchical, diverging network
6. Explains cladogenesis (origin of clades: species and species groups)
