## Experiment -2 Hydrostatic Bench

The Hydrostatic Bench enables the study of the main properties and the behavior of such liquids under hydrostatic conditions, with the aid of some accessories to make the different experiments.

## Equipment Description

The equipment consists of a metallic structure assembled on wheels with a panel at the top. In the lower part of the bench there is a tank where water is stored. Water is then sent to a methacrylate tank placed at the upper part of the bench and to other plastic deposit. Two hand-operated pumps are used for such distribution. The methacrylate tank is connected to two communicating tubes on the front panel, enabling to perform some practices; the other deposit placed on the horizontal surface of the bench is necessary for performing the rest of the practices. All water in excess is sent back to the storage tank by the drain. The rest of the equipment consists of the following different elements and independent accessories:

- Barometer (10)
- Thermometer (3)
- Ubbelohde capillary viscosimeter, $0.6-3 \mathrm{cp}(0 \mathrm{c})$
- Ubbelohde capillary viscosimeter, 2-10 cp (I)
- Ubbelohde capillary viscosimeter, 10-50 cp (Ia)
- Ubbelohde capillary viscosimeter, 60-300 cp (IIc)
- 3 graduated cylinders
- Accessory for demonstration of free surface in static conditions (7)
- Bourdon manometers calibration (13)
- Mercury manometers (9)
- Accessory to determine the metacentric height (FME11)
- Accessory for studying Archimedes' principle
- Accessory for studying the hydrostatic pressure (FME08) (14)
- Fluid level gauge calibrator (16)
- Set of weights ( $5,10,20,50,100,400,1000,2000,5000$ gr.)
- Air pump
- 2 water pumps (11 and 12)
- Universal hydrometer (1)
- Chronometer
- Set of measurement cylinders (2 of 600 ml ) (4)
- Spare parts for the viscosimeter elements

Figure 2.0.1. Main parts of the Hydraulic Bench

## Experiment -2.1

## Free surface of a static liquid

## Aim of this Experiment

To demonstrate that the surface of a static liquid is horizontal

## Necessary devices

We have to use tanks " 1 " and " 2 " and tubes "a", "b" and "c".

## Procedure

1. Make sure that V 1 communicates the receiver with the tubes.
2. Make sure that valves V3 and V4 are closed and open valves V1, V2 and V5.
3. Using the hand operated pump B, pump water from tank 1 to tank 2 until the level coincides with the first horizontal line in the wall.
4. Repeat for the second, third, and fourth horizontal lines, check that the water level is always horizontal, regardless of the size and the form of the tube.
5. Empty tank 2 by opening valve V1. Change the position of valve V5 in the upper part of tube "b" (tube "b" shall not have a free surface).
6. Using the hand operating pump A, fill tank 2 up to the level of the second, third and fourth line.
7. Observe that the level in tube " b " remains constant, while the level of the tank is followed in tubes "a" and "c".

## Experiment -2.2

## Pressure center in a smooth surface

## Aim of this Experiment

To determine the position of the pressure center on the rectangular face
of the float

## Necessary devices

Hydrostatic Pressure device or hydrostatic device.

1..-Receiver
3.- Pan
4.- Balance indicator or pointer
5.- Quadrant
6.- Set screw
7.- Arm
8.- Support;
9.- Adjustable counterweight
10.-Graduated scale
11.-Font flat surface
12.-Cock
13.- support feet

## Procedure

1. Measure and note down the dimensions designed as $a, L, d$, and $b$; the last corresponding to the flat surface placed at the end of the quadrant.
2. With the receiver placed on the bench, place the balance arm on the support (sharp profile). Hang the pan at the end of the arm.
3. Connect a length of flexible hose to the receiver draining cock and connect the other end to drain.
4. Level the receiver by properly acting on the support feet, which is adjustable, while the "bubble level" is observed.
5. Displace the counterweight of the arm until getting the arm to be horizontal.
6. Close the drain cock in the bottom of the receiver.
7. Introduce water in the receiver until its free surface is tangent to the lower edge of the quadrant. The fine adjustment of that level can be achieved by slightly overreaching the established filling and then slowly draining through the cock.
8. Place a calibrated weight on the balance pan and slowly add water until the balance arm recovers the horizontal position. Record the water level, indicated in the quadrant, and the value of the weight placed on the pan.
9. Repeat the operation above several times, increasing progressively the weight in the pan until, the balance arm is at level, the level of the free water surface becomes flush with the upper edge of the flat rectangular surface that the end of the quadrant presents.
10. From this point on, and in the order inverse to the operation above of placing the weights on the pan, the weight increments given in each step are removed, the arm is leveled (after every removal) by using the drain cock and the weight in the pan and the water level values are recorded.

For $\mathrm{y}<\mathrm{d}$ (partial immersion), calculate the practical ant the theoretical value of $\mathrm{m} / \mathrm{y}^{2}$ using the equation:

## $\mathrm{m} / \mathrm{y}^{2}=\mathrm{p} \cdot \mathrm{b} / 2 \mathrm{~L}(\mathrm{a}+\mathrm{d}-\mathrm{y} / 3)$.

The slope of this graph must be $-\mathrm{p} . \mathrm{b} / 2 \mathrm{~L}$, and its intersection with the coordinate axis $\mathrm{p} . \mathrm{b}$ $(\mathrm{a}+\mathrm{d}) / 2 \mathrm{~L}$.

See the discrepancies in a reasoned way, if any, between the average values measured and the values obtained with the equations above

| Weight | Height (y) | $\mathrm{y} / 3$ | $\mathrm{~m} / \mathrm{y}^{2}$ |
