## Activation Energy ( $\mathrm{E}_{\mathrm{a}}$ )

- $\mathrm{E}_{\mathrm{a}}$ value indicates that how temp. changes during processing or storage affect the $k$ value of the reaction.
- The higher $E_{a}$ value of the reaction, the more sensitive for the reaction to temp. changes during storage or processing.
- $E_{a}$ value is specific for each chemical, microbial and enzymatic reaction.
$\checkmark E_{a}$ cannot be directly measured.
$\checkmark \underline{E}_{\underline{a}}$ is calculated from Arrhenius equation.
This equation (described by Svante Arrhenius in 1889) gives the relationship between $k$ and temp. of processing or storage.
- Therefore, we need $k$ and temp. values to determine $\mathrm{E}_{\mathrm{a}}$

## Arrhenious equation

$$
\mathbf{k}=\mathbf{k}_{\mathbf{o}} \mathbf{e}^{-E a / R T}
$$

- k : Reaction rate constant (for any reaction order)
- $\mathrm{k}_{0}$ : frequency factor (same unit as $k$ )
- $\mathrm{E}_{\mathrm{a}}$ : Activation energy of the reaction (cal/mole of $\mathrm{J} / \mathrm{mole}$ )
- R: Gas constant ( $1.987 \mathrm{cal} /($ mole K$)$ or $8.314 \mathrm{~J} /($ mole K)
- T: Temperature (K)

## Take In of both sides

$$
-\mathrm{E}_{\mathrm{a}}
$$

-Find the equivalence of this equ. on $\log _{10}$

## To determine $\mathbf{E}_{\mathrm{a}}$ value graphically

$\checkmark$ First identify the quality factor of concern and then determine $k$ values at least at three different temp., preferably at five different processing or storage temp.
$\checkmark$ Then, plot $k$ values vs 1/T values.
> Using aritmetic graph paper: Take In of $k$ values and reciprocal of temp. values in Kelvin and then plot $I n k$ vs $1 / T$. Slope will be equal to $-E_{a} / R$.
> Using semi-log graph paper: Plot original $k$ values vs 1/T values. Slope will be equal to - $\mathrm{E}_{\mathrm{a}} / 2.303 \mathrm{R}$.
$\checkmark$ From slope, calculate $\mathrm{E}_{\mathrm{a}}$ value.

- Be aware that all $k$ values should be in the same order and the same unit for the calculation of $\mathrm{E}_{\mathrm{a}}$.
- Reactions that their $k$ value (rate) increase with temp. have negative slopes in Arrhenius plot.
Therefore, $\mathrm{E}_{\mathrm{a}}$ will always be positive.
- " $k_{0}$ " is equal to intercept value of Arrhenius graph.

Intercept $(b)=\ln \mathrm{k}_{\mathrm{o}}$

## Example

Oxidative degradation of aa was determined in orange juice at three different storage temperatures. Determine the $\mathrm{E}_{\mathrm{a}}$ value ( $\mathrm{kJ} / \mathrm{mole}$ ) for the degradation of aa.

## AA contents in orange juice stored at various temp.

| Temperature <br> $\left({ }^{\circ} \mathrm{C}\right)$ | Time <br> $(\mathrm{h})$ | AA content <br> $\left(\mathrm{mg} \mathrm{mL}^{-1}\right)$ |
| :---: | :---: | :---: |
| 23 | 20 | 0.948 |
|  | 40 | 0.476 |
|  | 60 | 0.004 |
| 35 |  |  |
|  | 10 | 1.029 |
| 45 | 20 | 0.758 |
|  |  | 0.261 |
|  | 5 | 1.200 |
|  | 10 | 0.655 |
|  |  | 0.109 |

## Example

Oxidative degradation of aa was determined in orange juice at three different storage temperatures. Determine the $\mathrm{E}_{\mathrm{a}}$ value ( $\mathrm{kJ} / \mathrm{mole}$ ) for the degradation of aa.

Note: The straight line in arithmetic graph paper was obtained from aa conc. vs time curve.

## Solution

Since reaction is zero-order, aa content versus storage period is plotted in arithmetic graph paper.

## $k$ vales are calculated from slopes

| Temperature <br> $\left({ }^{\circ} \mathrm{C}\right)$ | Slopes <br> $(\mathrm{mg} \mathrm{mL-}$ <br> $\left.\mathrm{h}^{-1}\right)$ | $k$ <br> $\left(\mathrm{mg} \mathrm{mL}^{-1} \mathrm{~h}^{-1}\right)$ |
| :---: | :---: | :---: |
| 23 | 0.0236 | $?$ |
| 35 | 0.0542 | $?$ |
| 45 | 0.1090 | $?$ |

## Values for Arrhenius plot of aa oxidation

| Temp. $\left({ }^{( } \mathbf{C}\right)$ | Temp.(K) | $\mathbf{1 / T x 1 0} \mathbf{0}^{3}$ <br> $(\mathbf{K})$ | $\mathbf{k}$ | lnk |
| :---: | :---: | :---: | :---: | :---: |
| 23 | 296 | 3.38 | 0.0236 | $-3,7465$ |
| 35 | 308 | 3.25 | 0.0542 | -2.9151 |
| 45 | 318 | 3.15 | 0.1090 | -2.2164 |

## Arrhenius plot ( $\ln k$ vs 1/T, arithmetic graph paper)

## Calculation of slope

$$
\begin{gathered}
\text { Slope }=\frac{-3.60-(-2.40)}{(3.35-3.17) \times 10^{-3}} \\
\text { or; } \\
\text { Slope }=\frac{-3.60-(-2.40)}{0.00335-0.00317}
\end{gathered}
$$

Slope $=-6667 \mathrm{~K}$

## Calculation of $E_{a}$

$$
\begin{aligned}
& \text { Slope }=-\frac{E_{a}}{R} \\
& -6667 \mathrm{~K}=\frac{-\mathrm{E}_{\mathrm{a}}}{1.987 \text { (unit?) }} \\
& \mathrm{E}_{\mathrm{a}}=13246 \text { (unit?) }
\end{aligned}
$$
