Statistics 1 Chapter 13 Linear Regression and Corelation

Ankara University, Faculty of Political Science, Department of Economics, Onur Özsoy 4/4/2018 **Chapter 13 Linear Regression and Correlation**

GOALS

When you have completed this chapter, you will be able to:

ONE

Draw a scatter diagram.

TWO

Understand and interpret the terms *dependent* variable and *independent* variable.

THREE

Calculate and interpret the coefficient of correlation, the coefficient of determination, and the standard error of estimate.

FOUR

Conduct a test of hypothesis to determine if there is a difference among block

means.

Ankara University, Faculty of Political Science, Department of Economics

Chapter 13 continued Linear Regression and Correlation

GOALS

When you have completed this chapter, you will be able to:

FIVE

Calculate the least squares regression line and interpret the slope and intercept values.

SIX

Construct and interpret a confidence interval and and prediction interval for the dependent variable.

SEVEN

Set up and interpret an ANOVA table.

Ankara University, Faculty of Political Science, Department of Economics

Correlation Analysis

- Correlation Analysis: A group of statistical techniques used to measure the strength of the relationship (correlation) between two variables.
- Scatter Diagram: A chart that portrays the relationship between the two variables of interest.
- Dependent Variable: The variable that is being predicted or estimated.
- Independent variable. The variable that provides the basis for estimation. It is the predictor variable.

4/4/2018

The Coefficient of Correlation, r The Coefficient of Correlation (r) is a measure of the strength of the relationship between two variables. > It requires interval or ratio-scaled data (variables). > It can range from -1.00 to 1.00. Values of -1.00 or 1.00 indicate perfect and strong correlation.

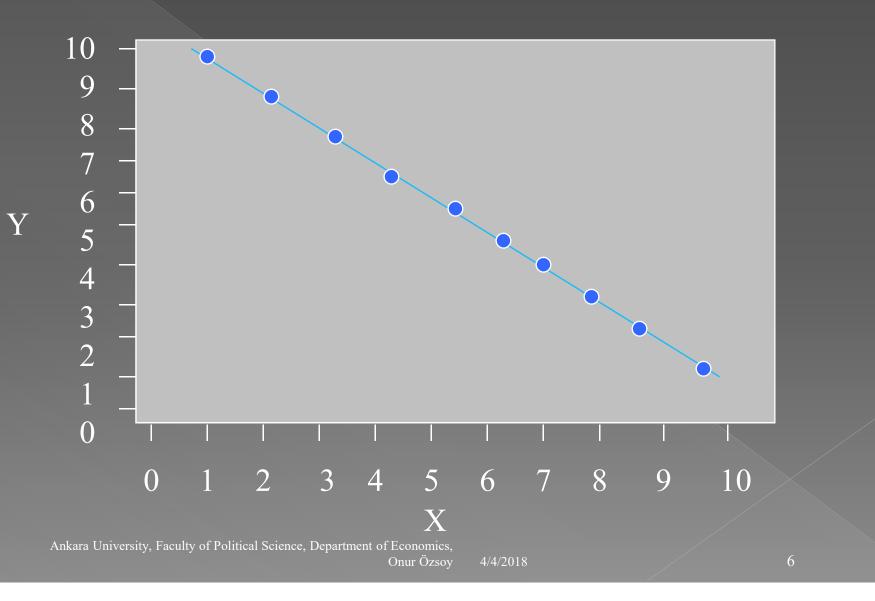

> Values close to 0.0 indicate weak correlation.

Onur Özsoy

 Negative values indicate an inverse relationship and positive values indicate a direct relationship.

12-4

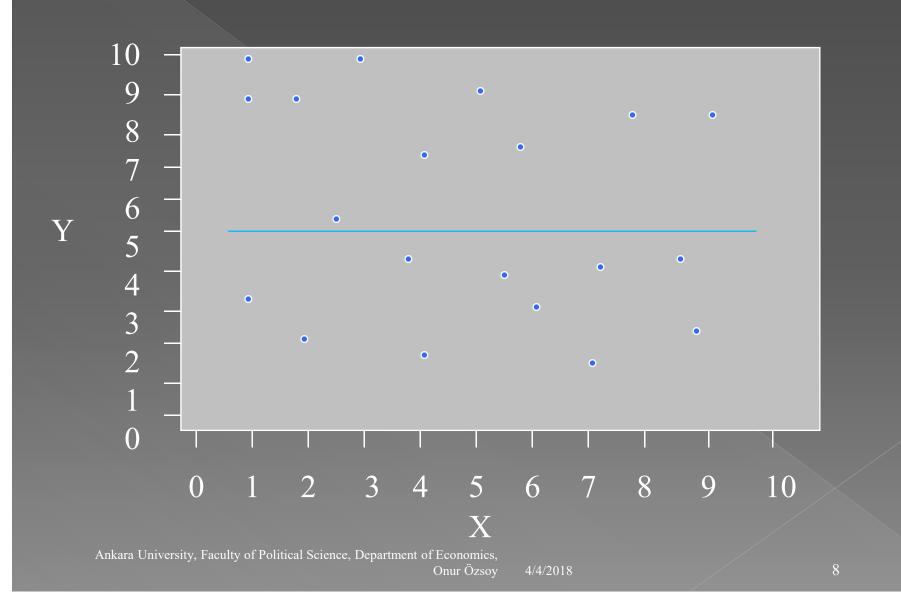

Perfect Negative Correlation

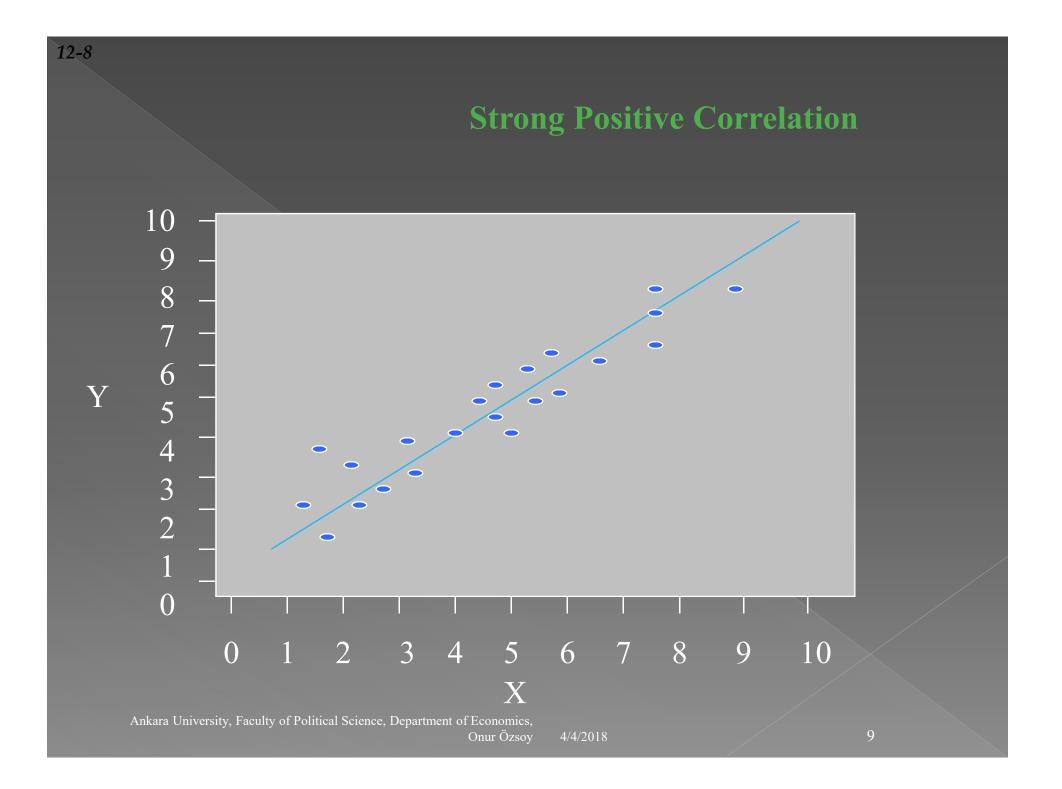

12-5

Zero Correlation

12-7

12-9

 $n(\Sigma XY) - (\Sigma X)(\Sigma Y)$ $= \sqrt{\left[n(\Sigma X^2) - (\Sigma X)^2\right] \left[n(\Sigma Y^2) - (\Sigma Y)^2\right]}$

Ankara University, Faculty of Political Science, Department of Economics,

Onur Özsoy 4/4/2018

Coefficient of Determination

 The Coefficient of Determination, r² the proportion of the total variation in the dependent variable Y that is explained or accounted for by the variation in the independent variable X.

 The coefficient of determination is the square of the coefficient of correlation, and ranges from 0 to 1.

Onur Özsoy 4/4/2018

EXAMPLE 1

12-11

• Dan Ireland, the student body president at Toledo State University, is concerned about the cost of textbooks. To provide insight into the problem he selects a sample of eight textbooks currently on sale in the bookstore. He decides to study the relationship between the number of pages in the text and the cost. Compute the correlation

Ankara University, Faculty of Political Science, Department of Economics, Onur Özsov

soy 4/4/2018

EXAMPLE 1 continued

Book	Pages	C o s t (\$)
1	500	2 8
2	7 0 0	2 5
3	8 0 0	3 3
4	600	2 4
5	4 0 0	2 3
6	500	2 7
7	600	2 1
8	8 0 0	3 1

13

12-12

EXAMPLE 1 continued

• r=.614 (verify)

 Test the hypothesis that there is no correlation in the population. Use a .02 significance level.

 Step 1: H₀ The correlation in the population is zero. H₁ The correlation in the population is not zero.

• Step 2: H_0 is rejected if t>3.143 or if t<-3.143, df=6, α =.02

EXAMPLE 1 continued

 The test statistic is t=1.9055, computed by
 t = r√n - 2/√(1 - r²)
 with (n-2) degrees of
 freedom

 Step 4 H₀ is not rejected

Ankara University, Faculty of Political Science, Department of Economics,

Onur Özsoy 4/4/2018

Regression Analysis

- Purpose: to determine the regression equation; it is used to predict the value of the dependent variable (Y) based on the independent variable (X).
- Procedure: select a sample from the population and list the paired data for each observation; draw a scatter diagram to give a visual portrayal of the relationship; determine the
 Antara progression equation.44/2018

Regression Analysis

- the regression equation: Y'= a + bX, where:
- Y' is the average predicted value of Y for any X.
- a is the Y-intercept, or the estimated Y value when X=0
- b is the slope of the line, or the average change $in \sum_{x} f \rho f = \rho c h c h q n g e$ of one unit if $X = \frac{n(\Sigma X^2) - (\Sigma X)^2}{n(\Sigma X^2) - (\Sigma X)^2}$

4/4/2018

• the least ξάμακεξ principle is used to obtain a & b:

Ankara University, Faculty of Political Science, Department of Economics, Onur Özsov

EXAMPLE 2

12-17

 Develop a regression equation for the information given in EXAMPLE 1 that can be used to estimate the selling price based on the number of pages.

By the least squares principle, b=.01714 and a=16.00175
 Y' =16.00175 + .01714X

Onur Özsov 4/4/2018

The Standard Error of Estimate

 The slandard error of estimate measures the scatter, or dispersion, of the observed values around the line of regression

• The formulas that are used to compute the standard error: $S_{Y,Y} = \sqrt{\frac{\sum (Y - Y')^2}{(Y - Y')^2}}$

$$= \sqrt{\frac{\Sigma Y^2 - a(\Sigma Y) - b(\Sigma X Y)}{n - 2}}$$

Ankara University, Faculty of Political Science, Department of Economics,

Onur Özsoy 4/4/2018

Assumptions Underlying
 Linear Regression
 For each value of X, there is a group of Y values, and these Y values are normally distributed.

- The means of these normal distributions of Y values all lie on the straight line of regression.
- The standard deviations of these normal distributions are equal.

The Y values are statistically independent. This means that in the selection of a sample, the Y values
Ankara Cohose Philips Proceedings Iqr X value do not 20

Confidence Interval

12-20

The confidence interval for the mean value of Y for a given value of X is given by:

$$Y' \pm t \cdot (S_{Y \cdot X}) \sqrt{\frac{1}{n} + \frac{(X - \overline{X})^2}{\Sigma X^2 - \frac{(\Sigma X)^2}{n}}}$$

Onur Özsoy

Prediction Interval

12-21

The prediction interval for an individual value of Y for a given value of X is given by:

$$Y' \pm t \cdot (S_{Y \cdot X}) \sqrt{1 + \frac{1}{n} + \frac{(X - \overline{X})^2}{\Sigma X^2 - \frac{(\Sigma X)^2}{n}}}$$

Ankara University, Faculty of Political Science, Department of Economics,

Onur Özsoy 4/4/2018

EXAMPLE 3

Use the information from EXAMPLE 1 to:
 Compute the standard error of estimate:

$$S_{Y \cdot X} = 3.471$$

- Develop a 95% confidence interval for all 650 page textbooks: [24.03, 30.25] Verify
- Develop a 95% prediction interval for a 650 page text: [18.09, 36.19] Verify

More on the Coefficient of Determination

 $r^{2} = \frac{\text{Total variation - unexplained variation}}{\text{Total variation}}$ $= \frac{\Sigma (Y - \overline{Y})^{2} - \Sigma (Y - Y')^{2}}{\Sigma (Y - \overline{Y})^{2}}$

Regression = $SSR = \Sigma (Y' - \overline{Y})^2$ Error variation = $SSE = \Sigma (Y - Y')^2$ Total variation = SS total = $\Sigma (Y - \overline{Y})^2$

Ankara University, Faculty of Political Science, Department of Economics,

12-23

More on the Coefficient of Determination

$$r^{2} = \frac{SSR}{SS \ total} = 1 - \frac{SSE}{SS \ total}$$
$$S_{Y \cdot X} = \sqrt{\frac{SSE}{n-2}}$$

Ankara University, Faculty of Political Science, Department of Economics,
