**a few of the positive ions (red) cross the membrane from right to left, leaving their negative counterions (red) behind; this sets up a nonzero membrane potential**

K<sup>+</sup> Kanalları: Na<sup>+</sup> kanalları ile benzer çapta olmalarına rağmen 10.000 kat daha iyi iletir. Tek bir amino asit değişikliği bile seçiciliğin kaybolmasına ve hücre ölümüne yol açar.

Yüksek geçirgenlik seçici ve yüksek afinitedeki K<sup>+</sup> bağlama bölgelerine uygundur.

Hem yüksek afinite, hem geçirgenlik?

transmembran proteinlerdeki eksi yüklü aminoasitlerin sitozolde yerleşimi, katyonların çekilerek, anyonların itilmesini sağladığı düşünülmektedir.
