

ANKARA UNIVERSITY
FACULTY OF VETERINARY MEDICINE
DEPARTMENT OF ANATOMY

Specimens Prepared With The Organic Glass Method

What is Organic Glass?

- Submerging of an anatomic specimen into a specified viscous chemical called organic glass.
- Specimen could be processed with various anatomic techniques or not previously.
- Generally methyl methacrylate is used. The anatomical specimen is immersed into the liquid methylacrylate. Then the catalyser is added into the liquid for the hardening.
- Concrete methyl methacrylate appears to be the same as the glass. Transparent and durable.

Thank you for
your attention...
