ALCOHOLS

The word alcohol immediately brings to mind ethanol, the intoxicating compound in wine and beer.

The functional group of an alcohol is an -OH group bonded to an sp³ hybridized carbon

Methanol

Nomenclature

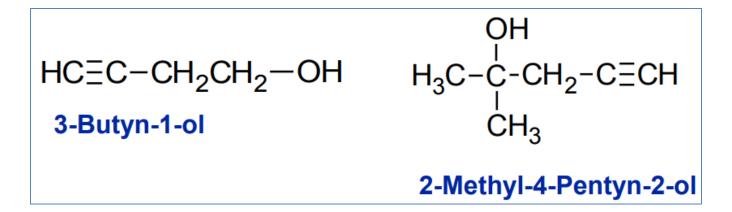

CH₃CH₂OH

³ ² ¹ CH₃CH₂CH₂OH

methanol

ethanol

1-propanol (methyl alcohol) (ethyl alcohol) (n-propyl alcohol)

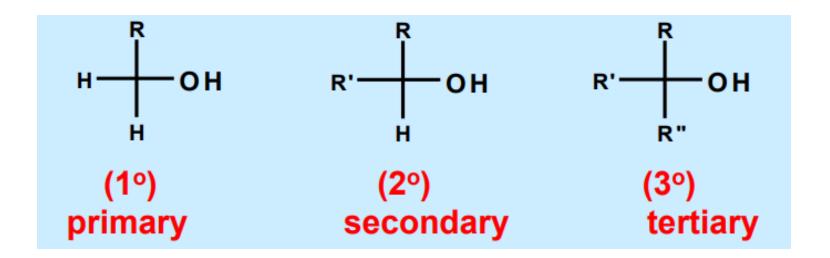

Nomenclature

- OH functional group is named as a **hydroxy** substituent when it appears on a structure with a **higher priority functional group** such as acids, esters, aldehydes and ketones.

Classification of Alcohols

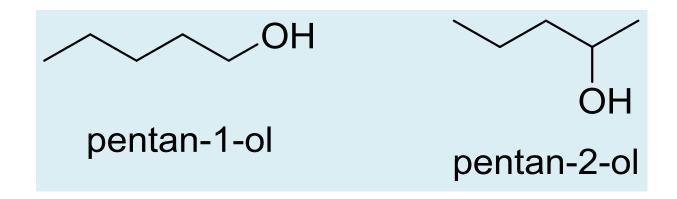

Alcohols are further classified as:

- Methyl alcohol (CH₃OH)
- primary (1°) alcohol
- secondary (2°) alcohol
- tertiary (3°) alcohol

Isomerism

n-Pentyl alcohol and sec-pentyl alcohol are constitutional isomers. They have the same molecular formula ($C_5H_{12}O$) but have different structures.

Isomerism

- Compounds with atoms connected in the same order but which differ in three-dimensional orientation, are stereoisomers.
- The terms "cis" and "trans" should be used to specify stereoisomeric • ring structures.

cis-Cyclopentane-1,2-diol

Physical Properties

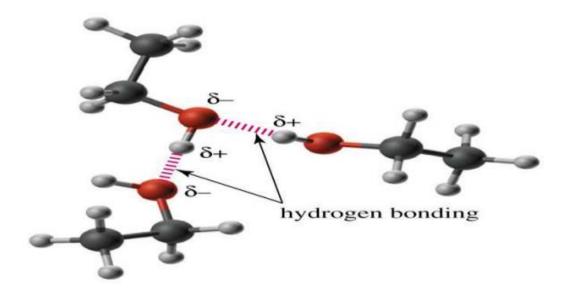

PHYSICAL STATES OF ALCOHOLS

- simple aliphatic alcohols \rightarrow **liquids** at room temperature.
- highly branched alcohols and alcohols with **twelve or more** carbon atoms \rightarrow **solids**.

Physical Properties

BOILING POINTS

	C₂H₅OH	CH ₃ CH ₂ CH ₃	CH ₃ CI
Relative molecular mass:	46	44	50.5
Boiling point:	46 78°C	-42°C	-24°C

Physical Properties

SOLUBILITY OF ALCOHOLS IN WATER

Alcohols are more soluble in water than hydrocarbons.

Higher alcohols are insoluble in water. - alcohol contains a polar end (-OH group) called 'hydrophilic' and a non-polar end (the alkyl group) called 'hydrophobic'.

- the water solubility decreases as the alkyl group becomes larger.

Acidity of Alcohols

• Most alcohols are about the same or slightly weaker acids than water.

$$CH_{3}O-H + O-H - CH_{3}O + H-O-H + H$$

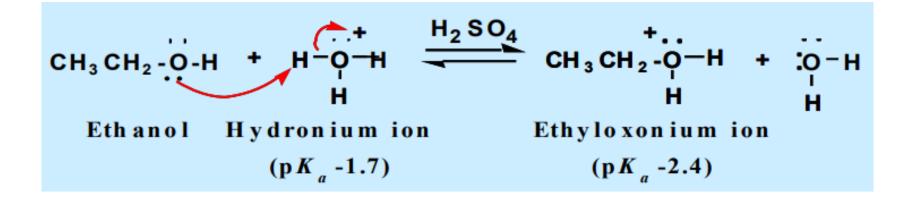

$$K_{a} = \frac{[CH_{3}O][H_{3}O^{+}]}{[CH_{3}OH]} = 3.2 \times 10^{-16}$$

$$PK_{a} = 15.5$$

$$- PKa = -\log Ka$$

Basicity of Alcohols

Alcohols can function as both very weak acids and weak bases.

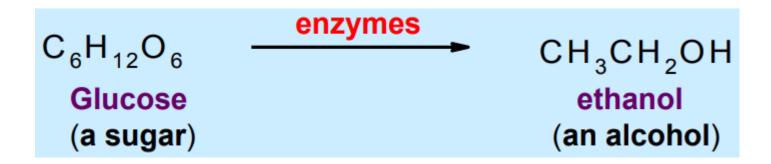

Methanol is manufactured from carbon monoxide and hydrogen.

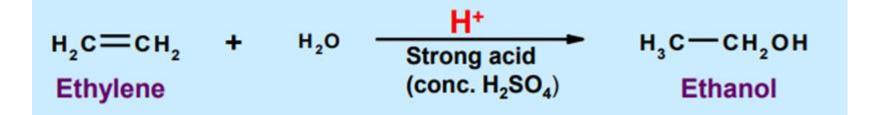

$$CO + 2H_2 \xrightarrow{ZnO/Cr_2O_3} CH_3OH$$

$$400^{\circ}C, 150 \text{ atm}$$

i. Fermentation of carbohydrates:

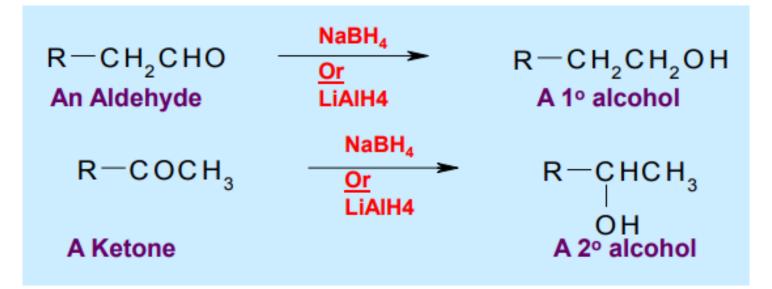

ii. Hydration of alkenes:

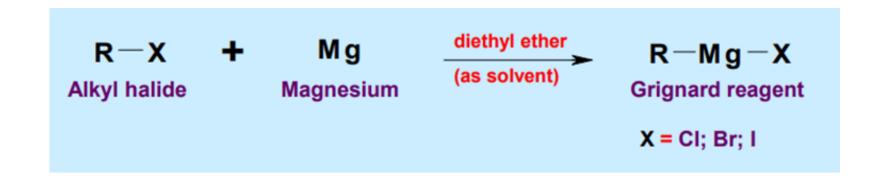

iii. Nucleophilic Substitution Reactions:

CH₃CH₂CH₂Br + NaOH_{aq} <u>heat</u> → CH₃CH₂CH₂OH + NaBr <u>1-Bromopropane</u> (a 1° alkyl halide) (a 1° alcohol)

iv. Reduction of Aldehydes and Ketones:

v. Grignard addition to Aldehydes and Ketones:

Grignard Reagents react with formaldehyde to give a 1° alcohol.

Grignard Reagents react with all other aldehydes to give 2° alcohols.

Grignard Reagents react with ketones to give 3° alcohols

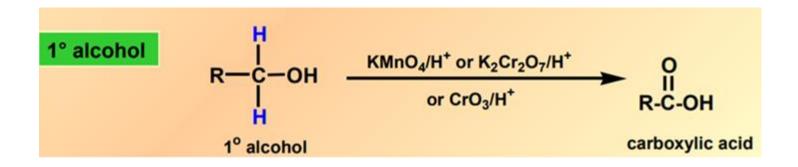

vi. Ester Hydrolysis:

$$R-C'O + R'-OH \longrightarrow R-C'O + HOH$$

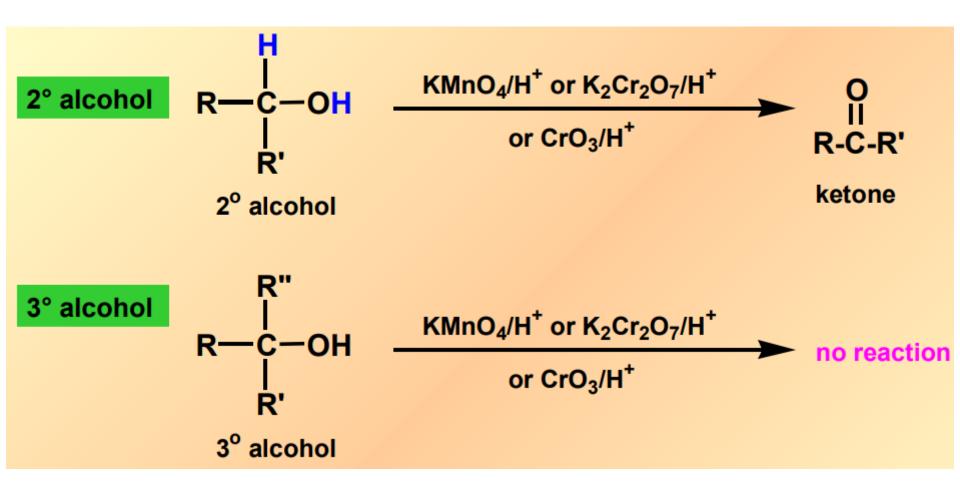

Reaction with Sodium

$2R-O-H + 2Na \longrightarrow 2R-O-Na^+ + H_2$

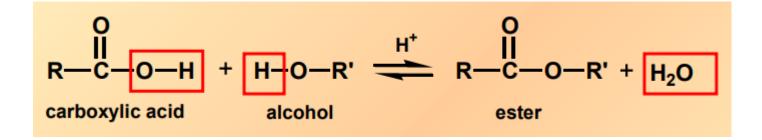

Oxidation

Oxidation

Esterification

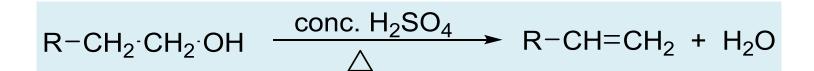

Halogenation reactions

 $R-OH + H-X \rightarrow R-X + H_2O$

$\textbf{R-OH + SOCl}_2 \rightarrow \textbf{R-CI + SO}_2 + \textbf{HCI}$

Dehydration

$$CH_3-CH_2-OH \xrightarrow{conc. H_2SO_4} CH_2=CH_2 + H_2O$$

Formation of ether (Williamson ether synthesis)

 $R-O^{\cdot}$ + R'-X → R-O-R' + X[·] alkoxide (R' must be primary)
