1878 – ilk kez kanatlılarda tanımlandı. (İtalya)
(Avian Influenza)

Segmentli yapı!

Influenza A virusları – insan, at, domuz, kanatlı, deniz memelileri

Influenza B virusları - insan

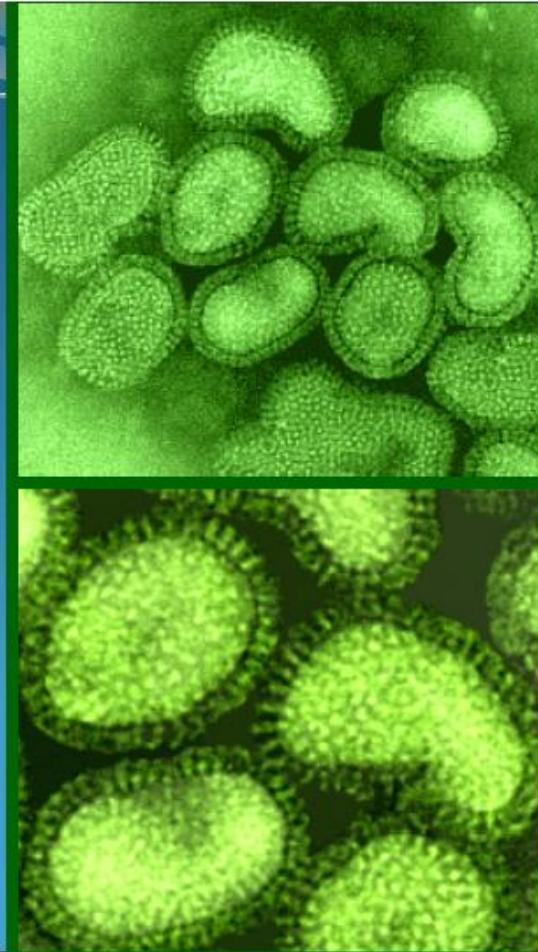

Influenza C virusları – insan ve domuz

<http://micro.magnet.fsu.edu/cells/viruses/influenzavirus.html>

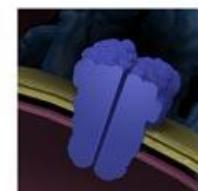

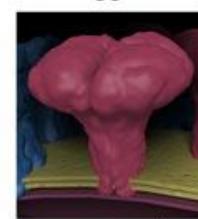

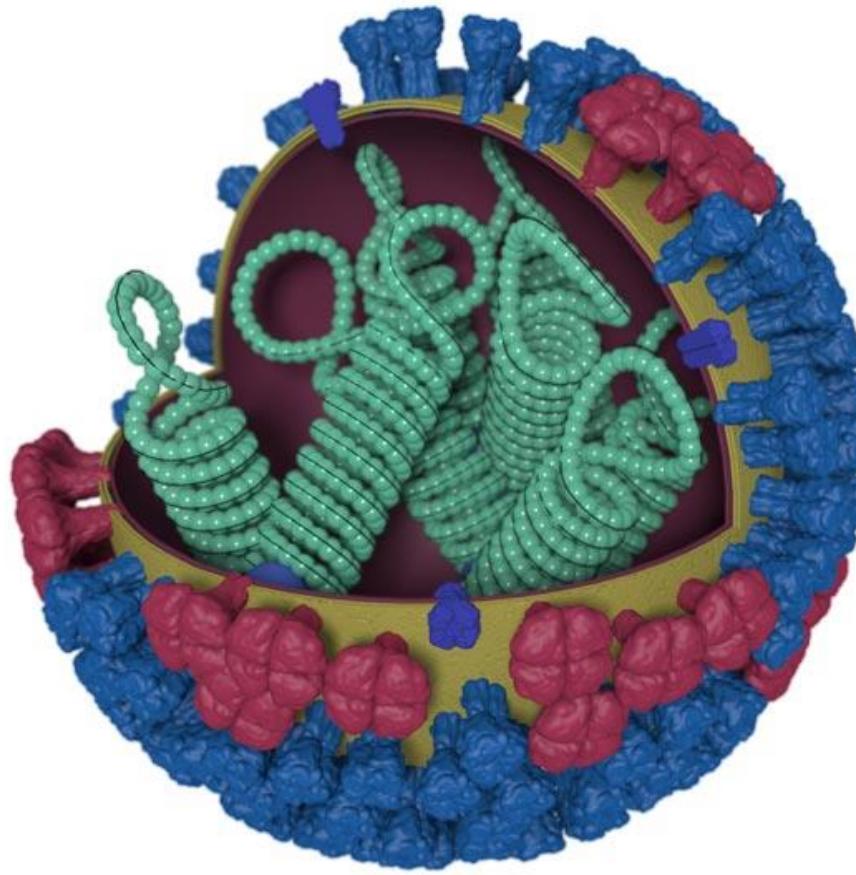

Virus Özellikleri

- 80-120 nm boyutlarında,
negatif polariteli, 8 segmentli
ve tek iplikçikli RNA genetik
materyali taşıyan zarflı
viruslardır.

- 56° C 30 dakika, pH 3 ve lipid
solventlere karşı duyarlıdırlar.

AN INFLUENZA VIRUS

<https://www.cdc.gov/flu/professionals/laboratory/antigenic.htm>

<https://www.cdc.gov/h1n1flu/images.htm>

Hemaglutinin (HA) ve Neuraminidaz (NA)

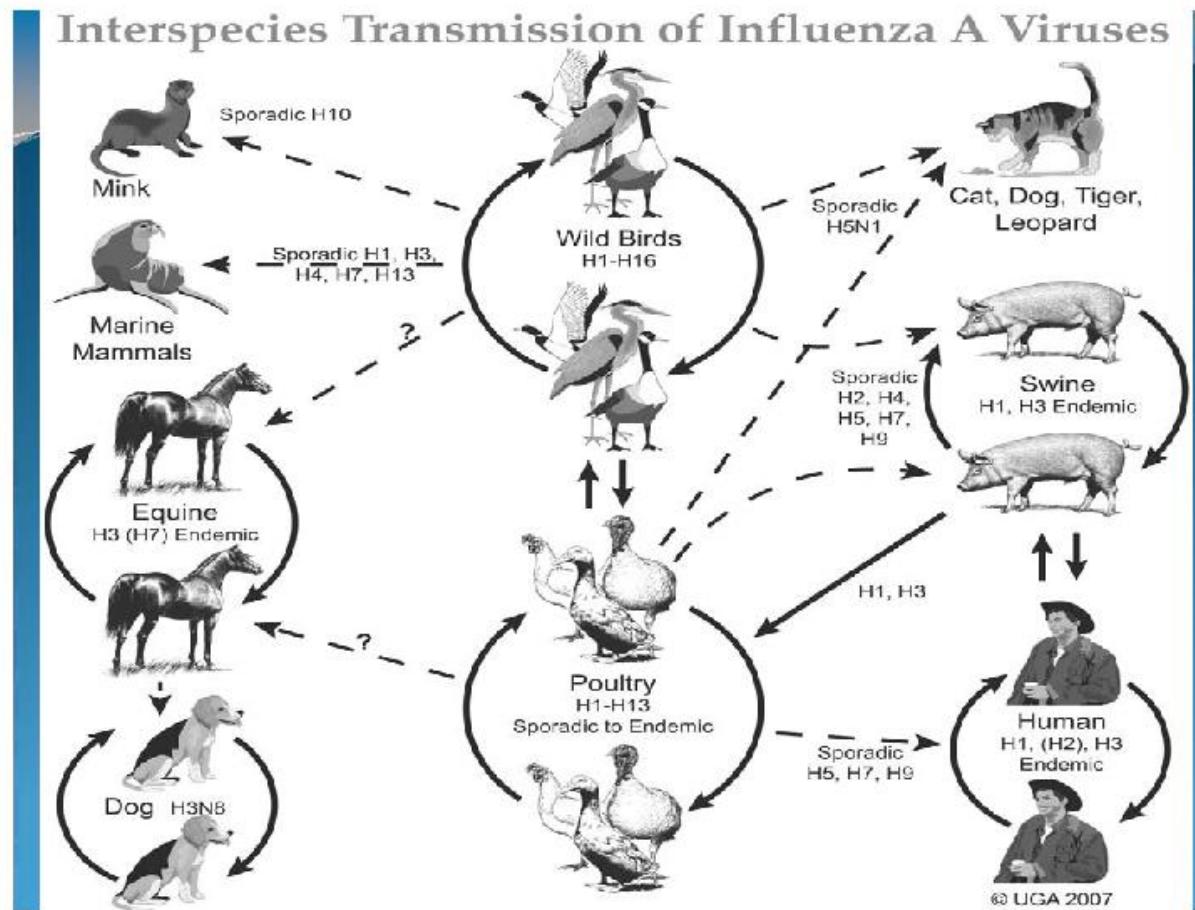

- Membran dışında bulunan yüzey glikoproteinleridir.
- HA, hücreye bağlanma (attachment ve penetrasyon), koruyucu antikor üretimini uyarma, virulensten sorumludur. Hücreye girişte **sialik asit** reseptörlerine bağlanır ve endositozu tetikler.
- NA, virionların hücreden ayrılması sırasında kazanılır. Antikor oluşumunu uyarır. Akciğerlerdeki mucusu hidrolize ederek virusun hücre yüzeyine tutunmasını sağlar.
- Influenza A virusları – 16 tane HA, 9 tane NA alt tipine göre farklı gruplar oluştururlar.

Influenza A yüzey antijenleri ve türlerdeki dağılımı

	Hemaglutinin tipleri															
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16
İnsan	X	X	X		!											
Domuz	X		X													
At			X					X								
Kuş	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X
	Nöraminidaz tipleri															
	1	2	3	4	5	6	7	8	9							
İnsan	X	X														
Domuz	X	X														
At							X	X								
Kuş	X	X	X	X	X	X	X	X	X							

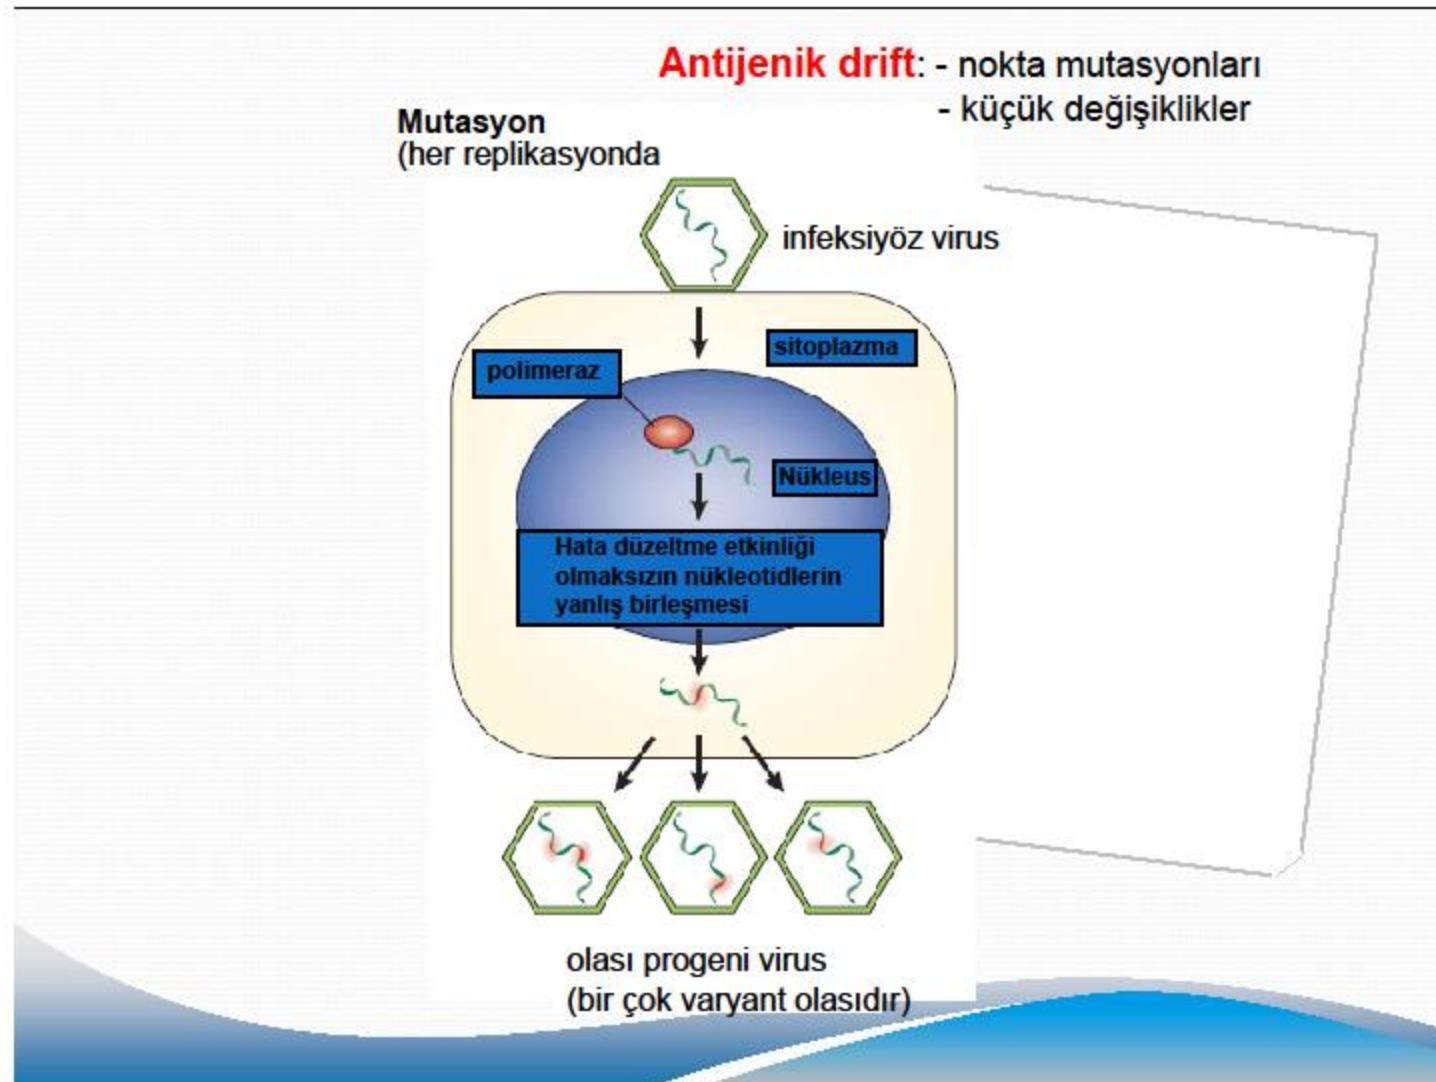

Influenza A virusları tür bariyerini geçebilirler ve bu nedenle daha tehlikelidirler.
Patogenezde etkili 3 mekanizma vardır:

- Direkt nakil (Türler arası)
- Adaptasyon
- Genetik reassortment

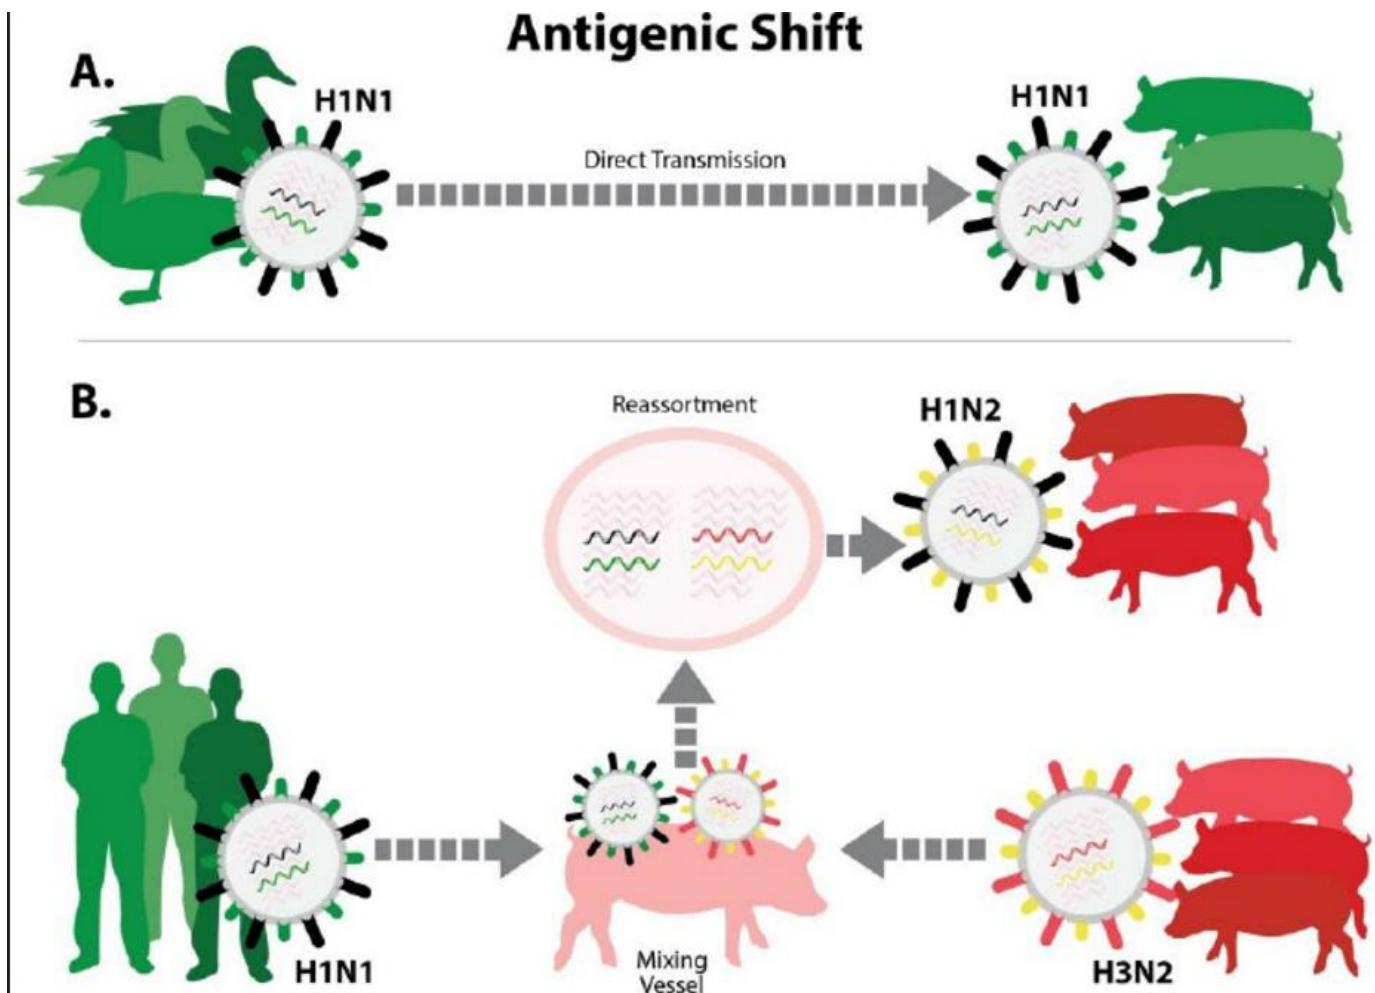

Antijenik Drift (Antijenik kayma) – Mekanizması ve Sonuçları

- Nokta mutasyonlar, yeni viruslar, kross bağışıklığının kaybı, epidemi

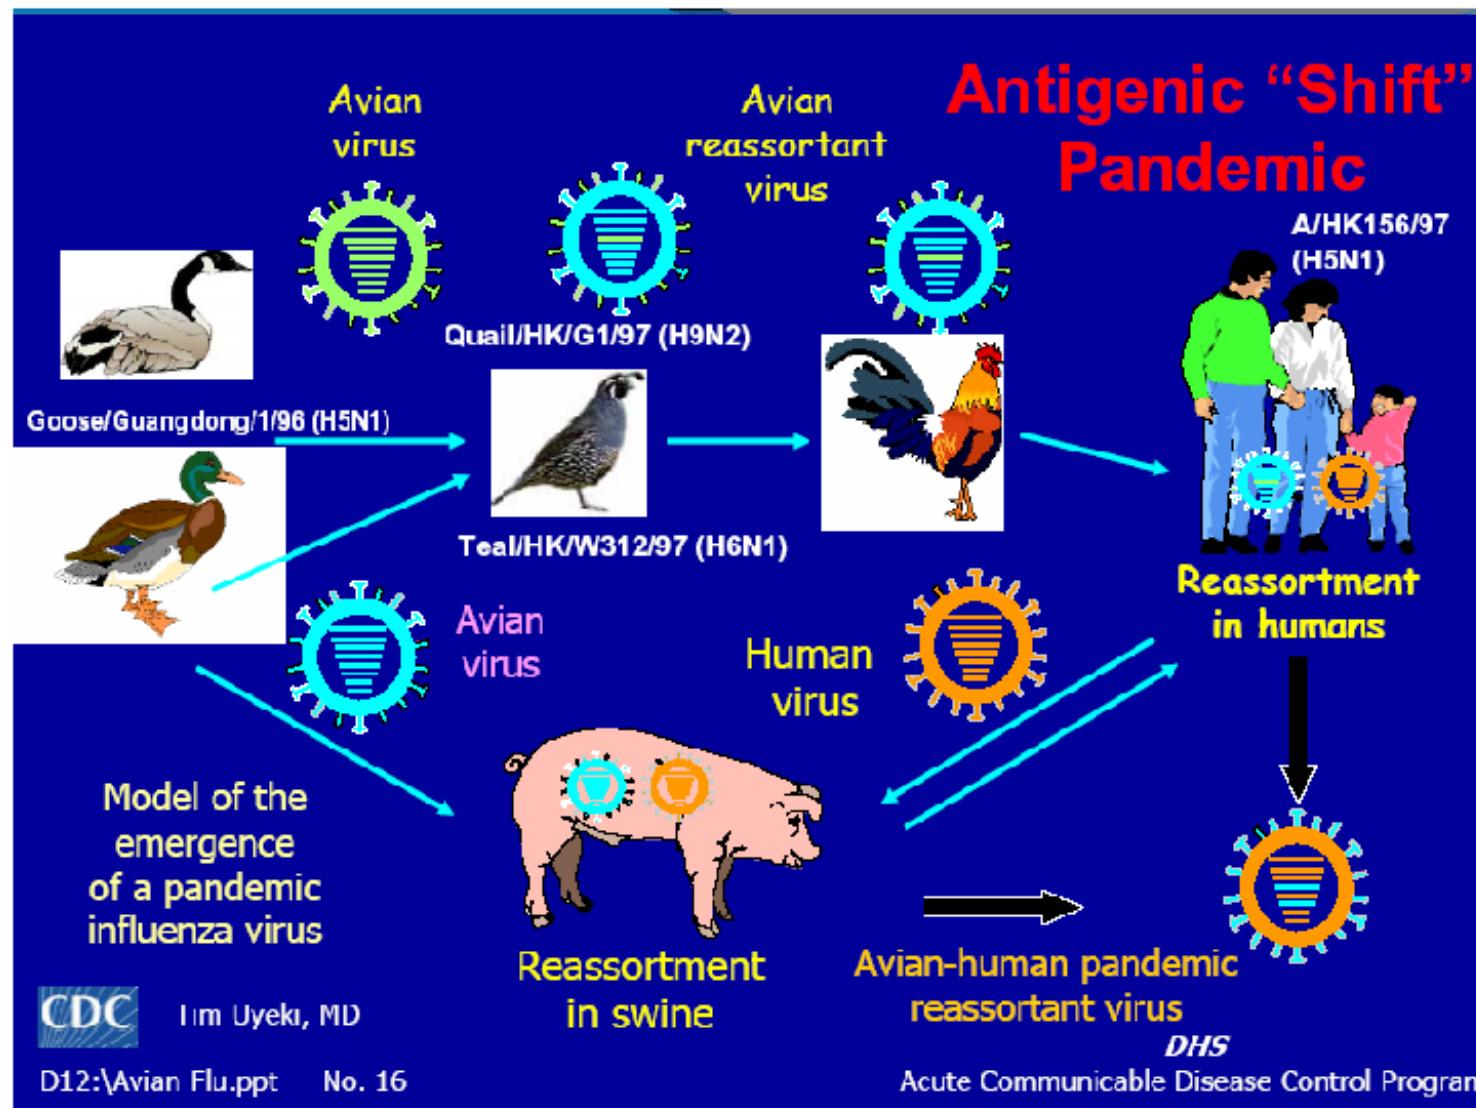

Antijenik Shift (Antijenik sapma) – Mekanizması ve Sonuçları

- Fenotipik değişiklikler, genetik reassortment (yeniden karışım), yeni HA ve NA alt tipi oluşumu, pandemi

Vaccines, 2015, 3, 22-73.

Farklı antijenik yapıdaki Influenza viruslarının aynı anda, aynı konagi enfekte etmesiyle meydana gelebilecek genetik materyal değişimleri salgılara yol açabilme özelliğine sahip yeni virusların ortaya çıkmasına neden olmaktadır.

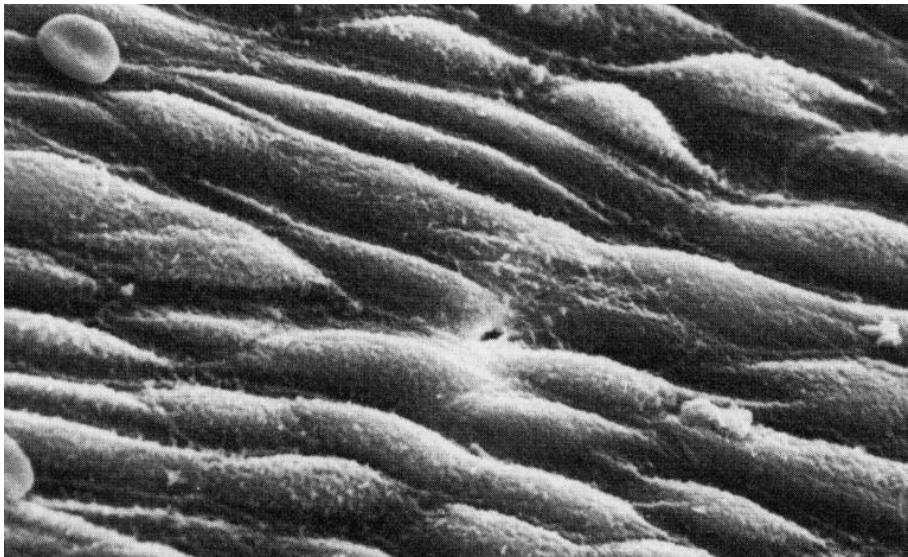

Bulaşma

AEROSOL

Influenza Viruslarının Patogenez Mekanizması

- Influenza virusları çoğalabilmek için, sialik asitten oluşan spesifik hücre reseptörlerine ihtiyaç duyarlar.
- Avian ve Equine influenza suşları sialik asit bağlantısını α 2,3 galaktoz bağına tercih ederler.
- İnsanlarda, sialik asit reseptörleri α 2,6 bağlanma konfigürasyonunda galaktoz kapsar.
- Domuzlardaki respiratorik kanal epitel hücreleri hem α 2,3 hem de α 2,6 linklerini kapsar. Bunlar hem insan hem avian virusları için duyarlıdır. Yeni reassortant virusların oluşumunda önem taşırlar.

Symptoms of Influenza

Call S, Vollenweider M, Hornung C, Simel D, McKinney W (2005). "Does this patient have influenza?". JAMA. 293 (8): 987–97. doi:10.1001/jama.293.8.987. PMID 15728170.

Avian influenza A(H7N9) virus

Courtesy of WHO Collaborating Centre for Reference and Research on Influenza,
National Institute of Infectious Diseases, Japan

Avian influenza A(H7N9) is a subtype of influenza viruses that have been detected in birds in the past. This particular A(H7N9) virus had not previously been seen in either animals or people until it was found in March 2013 in China.

However, since then, infections in both humans and birds have been observed. The disease is of concern because most patients have become severely ill. Most of the cases of human infection with this avian H7N9 virus have reported recent exposure to live poultry or potentially contaminated environments, especially markets where live birds have been sold. This virus does not appear to transmit easily from person to person, and sustained human-to-human transmission has not been reported.

FluNet Summary

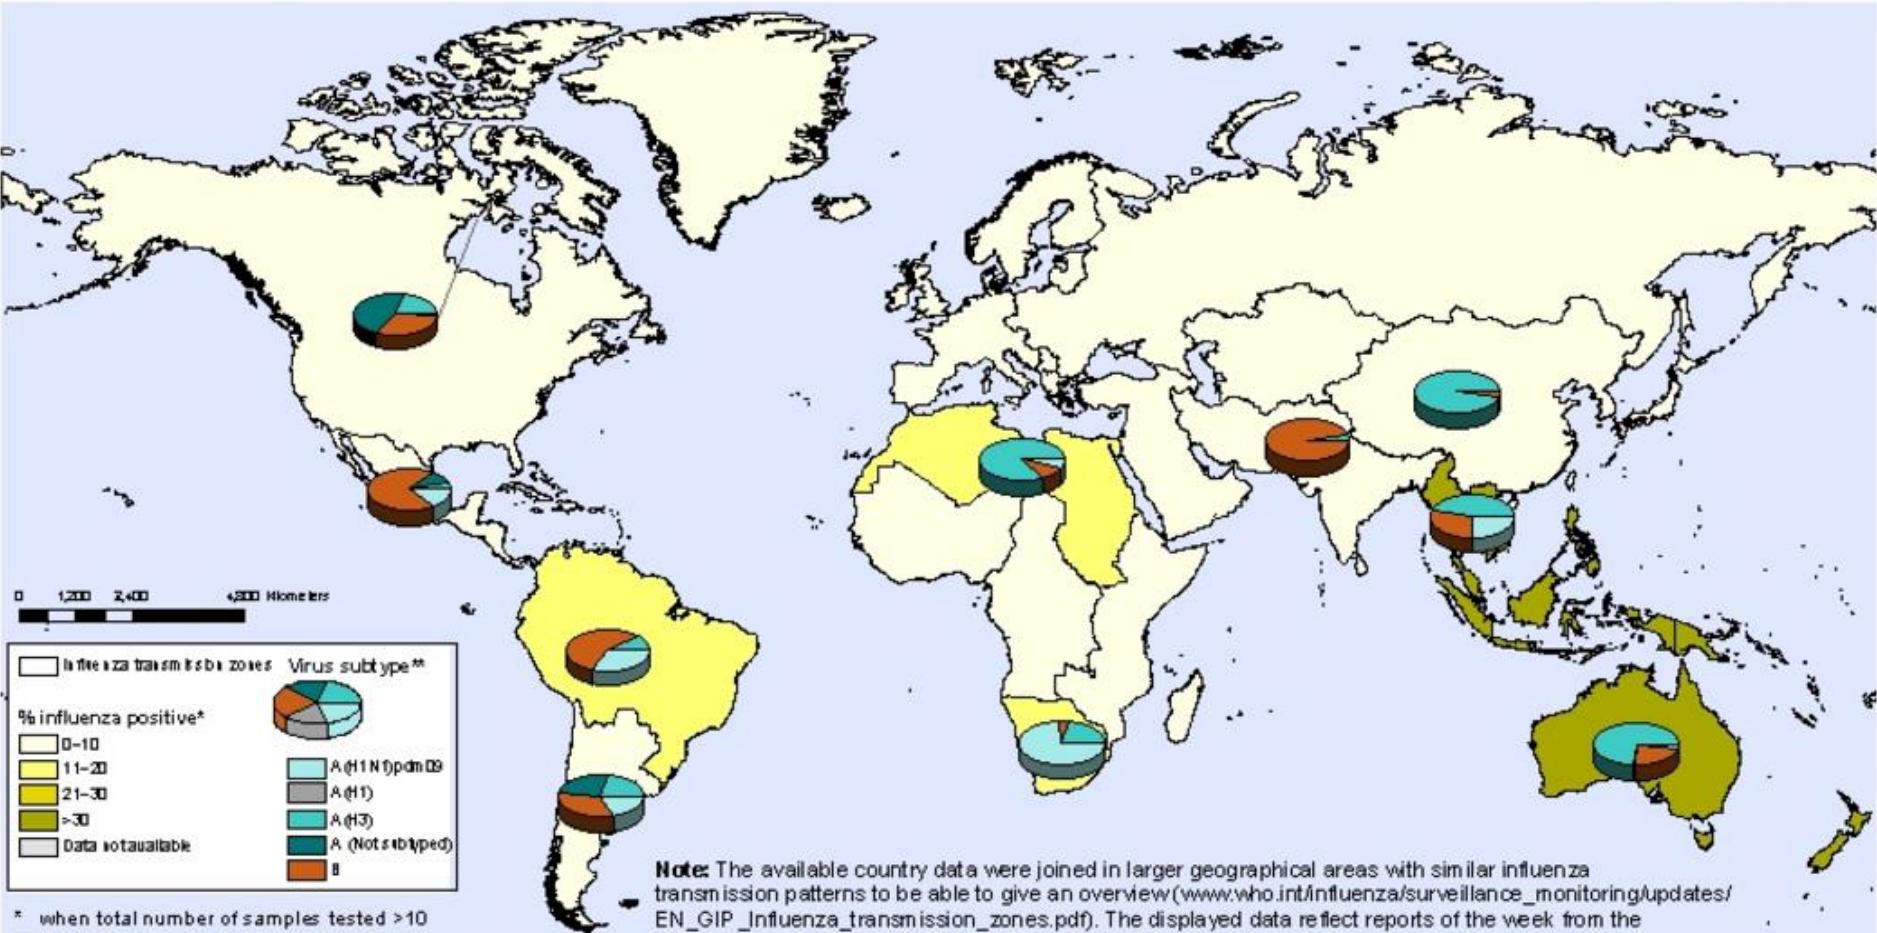

03 October 2016

Source: Laboratory confirmed data from the Global Influenza Surveillance and Response System (GISRS).

National Influenza Centres (NICs) and other national influenza laboratories from 73 countries, areas or territories reported data to FluNet for the time period from 05 September 2016 to 18 September 2016 ^a (*data as of 2016-09-30 03:56:53 UTC*). The WHO GISRS laboratories tested more than 44178 specimens during that time period. 2763 were positive for influenza viruses, of which 2260 (81.8%) were typed as influenza A and 503 (18.2%) as influenza B. Of the sub-typed influenza A viruses, 246 (12%) were influenza A(H1N1)pdm09 and 1812 (88%) were influenza A(H3N2). Of the characterized B viruses, 31 (24.6%) belonged to the B-Yamagata lineage and 95 (75.4%) to the B-Victoria lineage.

Percentage of respiratory specimens that tested positive for influenza By influenza transmission zone

Status as of 30 September 2016
